Section: part of the Periodic table

Complete each statement below by choosing a term from the following list. Some may be used more than once.

metal group elements	halogens	metals	transition metals
alkaline earth metals	alkali metals	halogens	inert gases

1. The alkali metals have a single electron in the highest occupied energy level.
2. The metal group elements are in the s and p-blocks of the periodic table.
3. All the alkaline earth metals have two valence electrons and get to a noble electron configuration by losing two electrons.
4. Unlike the metal group elements, each group of the transition metals does not have the identical outer electron configuration.
5. The halogens are the most reactive group of non-metals, achieving noble-gas-like configurations by gaining one electron.
6. The inert gases have a full set of electrons in their outermost energy level.
7. The alkali metals are very reactive and have low ionization.
8. The halogens are highly reactive and readily combine with metals.
9. In general, the alkaline earth metals are less reactive than the alkali metals and are good metal sources.
10. The inert gases are metals that experience electron repulsion from their inner or outer electron electrons.
11. Noble elements are metals.
12. With some exceptions, halogens form noble gases.

Answer the following questions in the space provided.

13. Which group contains the metal group elements?

alkali metals, alkali earth metals
