Morgan,2007-09-30 In October 2004 more than eight million citizens of Afghanistan turned out to vote in the first democratic election in the turbulent 5 000 year history of the country This incredible voter turnout in the face of horrific threats and actual bullets rockets and bombs was a shout of defiance and a significant setback to the former Taliban regime and their al Qaeda allies It was a stunning success and serious step forward for the Afghan people and for the United States in the campaign against international terrorism The change is more dramatic than the American Revolution in the aftermath of which the new American democracy maintained a representative form of government similar to its British roots The change is also more positive than the French Revolution which degenerated into tyranny and anarchy The Afghan Revolution of democratic governance albeit aided and guided by international military and political powers is thus one of the most historic events of our time Written by a former U S Army intelligence officer this book provides readers with a candid account of Afghanistan s first presidential election and its subsequent transition to democratic self governance In particular Morgan speaks to the security apparatus and the measures protecting the election The election s security process marked a defeat for the al Qaeda and Taliban terrorist insurgents attempting to frustrate Afghanistan s transformation into a democratic nation Morgan s narrative of Afghan development is interspersed with firsthand personal accounts from the author s eleven month deployment as an officer serving in the U S military in Afghanistan His stint there

Computational Materials Chemistry
L.A. Curtiss, M.S. Gordon, 2006-01-16 As a result of the advancements in algorithms and the huge increase in speed of computers over the past decade electronic structure calculations have evolved into a valuable tool for characterizing surface species and for elucidating the pathways for their formation and reactivity It is also now possible to calculate including electric field effects STM images for surface structures To date the calculation of such images has been dominated by density functional methods primarily because the computational cost of accurate wave function based calculations using either realistic cluster or slab models would be prohibitive DFT calculations have proven especially valuable for elucidating chemical processes on silicon and other semiconductor surfaces However it is also clear that some of the systems to which DFT methods have been applied have large non dynamical correlation effects which may not be properly handled by the current generation of Kohn Sham based density functionals For example our CASSCF calculations on the Si 001 acetylene system reveal that at some geometries there is extensive 86 configuration mixing This in turn could signal problems for DFT calculations on these systems Some of these problem systems can be addressed using ONIOM or other layering methods treating the primary region of interest with a CASMP2 or other multireference based method and treating the secondary region by a lower level of electronic structure theory or by use of a molecular mechanics method
