Treatment Of Common Hip Fractures Evidence Reporttechnology Assessment Number 184:

Treatment of Common Hip Fractures U. S. Department of Health and Human Services, Agency for Healthcare Research and Quality, 2013-04-19 Hip fractures rank in the top ten of all impairments worldwide in terms of loss in disability adjusted years for people 50 years old The absolute number of hip fracture hospitalizations in the United States is currently about 310 000 and this number is expected to continue to rise due to increased life spans and an aging baby boom generation Ninety percent of hip fractures result from a simple fall therefore efforts to prevent hip fractures are unlikely to have a substantial impact on hip fracture incidence The consequences for hip fractures in elderly individuals are significant in terms of lives lost and the associated negative impacts on hip fracture patients functioning and quality of life One year mortality for patients after a hip fracture is approximately 20 percent with men patients older than 75 years and nursing home patients at higher risk However it is not clear how much of that mortality is due to the fracture and its sequelae and how much to the underlying frailty that may predispose a person to a fracture Morbidity associated with hip fractures may include serious complications such as deep vein thrombosis and postoperative infection muscular deconditioning pain and loss of mobility Among patients who were living independently prior to a hip fracture only about half are able to walk unaided after fracture and about one fifth require long term placement in a care facility Hip fractures are generally classified into three major types depending on the specific location of the fracture femoral neck intertrochanteric and subtrochanteric fractures The term pertrochanteric hip fracture may also be used in hip fracture literature and refers to a more inclusive set of extracapsular fractures including intertrochanteric subtrochanteric and mixed fracture patterns The vast majority of hip fracture patients are treated with surgical repair The short term goal of surgical treatment is to stabilize the hip fracture enough to withstand early mobilization and weight bearing which prevents complications due to prolonged bed rest and aids in fracture healing The type of surgery is generally based on the fracture pattern and patient characteristics Pertrochanteric fractures are generally managed with internal fixation most often plate screw devices or intramedullary nails Femoral neck fractures are treated with either internal fixation or arthroplasty Hemiarthroplasty replaces the femoral head segment of the upper femur with an artificial implant The patient's own acetabulum is not replaced Total hip arthroplasty is the prosthetic replacement of the entire hip joint both the femoral head and the acetabulum within the pelvis The goal of treatment for hip fractures is to return patients to their pre fracture level of function There is a growing body of literature on treatment options and their effects on intermediary and patient post surgical treatment outcomes including several systematic reviews however no comprehensive organization of the evidence across all types of geriatric hip fractures currently exists The aim of the present project was to conduct a systematic review and synthesize the evidence of the effects of surgical treatments of fractures of the hip on patient post treatment outcomes which to date have received only modest attention but which are central to the patient's experience This review was asked to address the following key questions Key Question 1 What is the relationship

between patient variables the type of fracture and patient post treatment outcomes such as pain and functioning Key Question 2 What is the relationship between the type of fracture and patient posttreatment outcomes Key Question 3 What is the relationship between implant variables and patient posttreatment outcomes Key Question 4 What is the relationship between the type of intervention and patient post treatment outcomes *Total Hip Replacement* Vaibhav Bagaria,2018-11-07 The incidence of total hip arthroplasty is increasing in number because of successful outcomes Although technically challenging once mastered a hip replacement is one of the most gratifying surgeries for both patient and surgeon This book covers some of the most important aspects of hip replacement surgery These include preoperative planning anesthesia classification systems management of proximal femur fractures anterior approach complications and rehabilitation aspects of hip arthroplasty The book is intended for arthroplasty surgeons anesthesiologists and physical therapists who will find the book useful in parts and as a whole if they deal with arthroplasty cases on a regular basis Experience based narration of various subjects by authors ensures that first hand experience is passed on to readers in a simple easy to understand manner Essentials of Clinical Geriatrics 7/E Robert L. Treatment of Common Hip Fractures, 2009

OBJECTIVES To conduct a systematic review and synthesize the evidence for the effects of surgical treatments for subcapital and intertrochanteric subtrochanteric hip fractures on patient focused outcomes for elderly patients

DATA SOURCES MEDLINE r Cochrane databases Scirus and ClinicalTrials gov and expert consultants We also manually searched reference lists from relevant systematic reviews

REVIEW METHODS High quality quasi experimental design studies were used to examine relationships between patient characteristics type of fracture and patient outcomes Randomized controlled trials were used to examine relationships between type of surgical treatment and patient outcomes Patient mortality was examined with Forest plots Narrative analysis was used for pain quality of life QoL and functional outcomes due to inconsistently measured and reported outcomes

RESULTS Mortality does not appear to differ by device class or by devices within a class Nor on the whole do pain functioning and QoL Some internal fixation devices may confer earlier return to functioning over others for some patients but such gains are very short lived Very limited results suggest that subcapital hip fracture patients with total hip replacements have improved patient outcomes over internal fixation but it is unclear whether these results would continue to hold if the analyses included the full complement of relevant covariates Age gender prefracture functioning and cognitive impairment appear to be related to mortality and functional outcomes Fracture type does not appear to be independently related to patient outcomes Again however the observational literature does not include the full complement of potential covariates and it is uncertain if these results would hold

CONCLUSIONS Several factors limit our ability to definitively answer the key questions posed in this study using the existing literature Limited perspectives lead to incomplete sets of independent variables included in analyses Specific populations are poorly defined and separated for comparative study Fractures with widely varying biomechanical problems are often lumped together Outcome variables are inconsistently measured and reported making it very difficult to aggregate or even compare results If future high quality trials continue to support the evidence that differences in devices are short term at best within the first few weeks to few months of recovery policy implications involve establishing the value of a shorter recovery relative to the cost of the new device As the literature generally focuses on community dwelling elderly patients more attention needs

to be directed toward understanding implications of surgical treatment choices for the nursing home population **Future Research Needs for the Treatment of Common Hip Fractures** U. S. Department of Health and Human Services, Agency for Healthcare Research and Quality, 2013-05-17 The systematic review Treatments of Common Hip Fractures completed in August 2009 was the result of a topic nomination made by the American Academy of Orthopaedic Surgeons who were planning to formulate clinical guidelines for surgical procedures for implantable devices The nominator was interested in understanding the interaction between patient factors fracture types types of surgical implants and outcomes Following refinement the key questions addressed were Key Question 1 What is the relationship between patient variables e g demographic factors comorbidities the type of fracture i e intertrochanteric subtrochanteric subcapital and post treatment outcomes e g pain mobility mortality Key Question 2 What is the relationship between the type of fracture i e intertrochanteric subtrochanteric subcapital and post treatment outcomes e g pain mobility mortality Key Question 3 What is the relationship between implant variables e g position material method and design of implant and patient posttreatment outcomes e g pain mobility mortality Key Question 4 What is the relationship between the type of intervention e g internal fixation versus arthroplasty and patient post treatment outcomes e g pain mobility mortality The systematic review was unable to fully answer the research questions with the existing literature generally because of two main factors 1 the limited perspective of discipline specific investigations i e orthopaedics or epidemiology which tended to use incomplete sets of important independent variables in study designs and models and 2 the generally low quality of hip fracture outcome studies to date where specific populations were poorly defined and the use of inconsistent outcome variables prevented aggregating or even comparing results The latter problem of inconsistent outcomes measures is a general issue for most mobility literature Additionally very little literature was available to provide evidence for the multitude of comparisons of device variables within a class of devices i e number of screws or the specific design for sliding hip screw implants With this inability to show either greater effectiveness or equivalency between device variables or between devices within a class aggregating the comparisons at the level of head to head comparisons of classes of devices becomes problematic **Hip Fracture Outcomes in People Age 50 and Over** Katie Maslow, 1993 **Hip Fracture**, 1990
