Trends in Harmonic Analysis Massimo A. Picardello, 2012-12-05 This book illustrates the wide range of research subjects developed by the Italian research group in harmonic analysis originally started by Alessandro Fig Talamanca to whom it is dedicated in the occasion of his retirement In particular it outlines some of the impressive ramifications of the mathematical developments that began when Fig Talamanca brought the study of harmonic analysis to Italy the research group that he nurtured has now expanded to cover many areas Therefore the book is addressed not only to experts in harmonic analysis summability of Fourier series and singular integrals but also in potential theory symmetric spaces analysis and partial differential equations on Riemannian manifolds analysis on graphs trees buildings and discrete groups Lie groups and Lie algebras and even in far reaching applications as for instance cellular automata and signal processing low discrepancy sampling Gaussian noise

Operator Theory and Harmonic Analysis Alexey N. Karapetyants, Vladislav V. Kravchenko, Elijah Liflyand, Helmuth R. Malonek, 2021-09-27 This volume is part of the collaboration agreement between Springer and the ISAAC society This is the first in the two volume series originating from the 2020 activities within the international scientific conference Modern Methods Problems and Applications of Operator Theory and Harmonic Analysis OTHA Southern Federal University in Rostov on Don Russia This volume is focused on general harmonic analysis and its numerous applications The two volumes cover new trends and advances in several very important fields of mathematics developed intensively over the last decade The relevance of this topic is related to the study of complex multiparameter objects required when considering operators and objects with variable parameters

Recent Advances in Harmonic Analysis and Applications Dmitriy Bilyk, Laura De Carli, Alexander Petukhov, Alexander M. Stokolos, Brett D. Wick, 2012-10-16 Recent Advances in Harmonic Analysis and Applications features selected contributions from the AMS

conference which took place at Georgia Southern University Statesboro in 2011 in honor of Professor Konstantin Oskolkov's 65th birthday. The contributions are based on two special sessions namely Harmonic Analysis and Applications and Sparse Data Representations and Applications. Topics covered range from Banach space geometry to classical harmonic analysis and partial differential equations. Survey and expository articles by leading experts in their corresponding fields are included and the volume also features selected high quality papers exploring new results and trends in Muckenhoupt-Sawyer theory, orthogonal polynomials, trigonometric series, approximation theory, Bellman functions and applications in differential equations. Graduate students and researchers in analysis will be particularly interested in the articles which emphasize remarkable connections between analysis and analytic number theory. The readers will learn about recent mathematical developments and directions for future work in the unexpected and surprising interaction between abstract problems in additive number theory and experimentally discovered optical phenomena in physics. This book will be useful for number theorists, harmonic analysts, algorithmists in multi-dimensional signal processing and experts in physics and partial differential equations.

Geomathematics: Theoretical Foundations, Applications and Future Developments Frits

Agterberg, 2014-07-14 This book provides a wealth of geomathematical case history studies performed by the author during his career at the Ministry of Natural Resources Canada, Geological Survey of Canada, NRCan, GSC. Several of the techniques newly developed by the author and colleagues that are described in this book have become widely adopted not only for further research by geomathematical colleagues but by government organizations and industry worldwide. These include Weights of Evidence modelling, mineral resource estimation, technology trend surface analysis, automatic stratigraphic correlation and nonlinear geochemical exploration methods. The author has developed maximum likelihood methodology and spline fitting techniques for the construction of the international numerical geologic timescale. He has introduced the application of new theory of fractals and multi-fractals in the geostatistical evaluation of regional mineral resources and ore reserves and to study the spatial distribution of metals in rocks. The book also contains sections deemed important by the author but that have not been widely adopted because they require further research. These include the geometry of preferred orientations of contours and edge effects on maps, time series analysis of Quaternary retreating ice sheet related sedimentary data, estimation of first and last appearances of fossil taxa from frequency distributions of their observed first and last occurrences, tectonic reactivation along pre-existing schistosity planes in fold belts, use of the grouped jackknife method for bias reduction in geometrical extrapolations and new applications of the theory of permanent volume independent frequency distributions.

Real And Stochastic Analysis: Current Trends Malempati Madhusudana Rao, 2013-11-26 This book presents the current status and research trends in Stochastic Analysis. Several new and emerging research areas are described in detail highlighting the present outlook in Stochastic Analysis and its impact on abstract analysis. The book focuses on treating problems in areas

that serve as a launching pad for continual research Statistical Methods for Trend Detection and Analysis in the Environmental Sciences Richard Chandler, Marian Scott, 2011-03-25 The need to understand and quantify change is fundamental throughout the environmental sciences This might involve describing past variation understanding the mechanisms underlying observed changes making projections of possible future change or monitoring the effect of intervening in some environmental system This book provides an overview of modern statistical techniques that may be relevant in problems of this nature Practitioners studying environmental change will be familiar with many classical statistical procedures for the detection and estimation of trends However the ever increasing capacity to collect and process vast amounts of environmental information has led to growing awareness that such procedures are limited in the insights that they can deliver At the same time significant developments in statistical methodology have often been widely dispersed in the statistical literature and have therefore received limited exposure in the environmental science community This book aims to provide a thorough but accessible review of these developments It is split into two parts the first provides an introduction to this area and the second part presents a collection of case studies illustrating the practical application of modern statistical approaches to the analysis of trends in real studies Key Features Presents a thorough introduction to the practical application and methodology of trend analysis in environmental science Explores non parametric estimation and testing as well as parametric techniques Methods are illustrated using case studies from a variety of environmental application areas Looks at trends in all aspects of a process including mean percentiles and extremes Supported by an accompanying website featuring datasets and R code The book is designed to be accessible to readers with some basic statistical training but also contains sufficient detail to serve as a reference for practising statisticians It will therefore be of use to postgraduate students and researchers both in the environmental sciences and in statistics *Spectral Analysis in Geophysics* B.M.
