Tissue Engineering Research Trends Giovanni N.

Greco,2008 Tissue engineering is the use of a combination of cells engineering and materials methods and suitable biochemical and physiochemical factors to improve or replace biological functions While most definitions of tissue engineering cover a broad range of applications in practice the term is closely associated with applications that repair or replace portions of or whole tissues i.e. bone cartilage blood vessels bladder etc Often the tissues involved require certain mechanical and structural properties for proper function The term has also been applied to efforts to perform specific biochemical functions using cells within an artificially created support system e.g. an artificial pancreas or a bioartificial liver The term regenerative medicine is often used synonymously with tissue engineering although those involved in regenerative medicine place more emphasis on the use of stem cells to produce tissues
