Voltage Stability Assessment at Integrated Electric Power System with Wind Power Generation in South Sulawesi Indonesia

Abstract: Today the use of renewable energy is being encouraged to overcome the limitations of fossil energy. One of the renewable energies utilized in South Sulawesi Indonesia is wind energy. The weakness of wind power plants is that the energy produced is not constant so that it can affect the stability of integrated conventional systems. This research discusses the stability of systems integrated with renewable energy generators. The method used is the New Voltage Stability Index. The results showed that the highest stability index occurred in the Sidera to Sidera 70 kV networks of 0.157433. The second stability index value on the network from Tello to 30 kV Tello is 0.153720. The third stability index value occurs in the network from 150 kV Powatu to Powatu 70 kV of 0.149948. The value of the simulation results of the system stability index below 1 or in a stable state.

Jedną z odnawialnych źródeł energii wykorzystywanych w południowym Sulawesi w Indonezji jest energia wiatrowa. Słabością elektrowni wiatrowych jest to, że wytwarzana energia nie jest stała, przez co może wpłynąć na stabilność zintegrowanych systemów konwencjonalnych. W pracy omówiono stabilność systemów zintegrowanych z generatorami energii odnawialnej. Stosowaną metodą jest nowy wskaźnik stabilności napięcia. Wyniki wykazały, że najwyższy wskaźnik stabilności wystąpił w sieciach Sidera-Sidera 70 kV wynoszący 0.157433. Drugi wskaźnik wskaźnika stabilności w sieci od Tello do 30 kV Tello wynosi 0.153720. Trzeci wskaźnik wskaźnika stabilności występuje w sieci od 150 kV Powatu do Powatu 70 kV wynoszącej 0.149948. Wartość wyników symulacji wskaźnika stabilności systemu poniżej 1 lub w stanie stabilnym. Introduction

Power system analysis is of particular concern to electricity engineers, especially with regard to voltage stability. Voltage stability is currently a serious concern regarding the design, planning and operation of systems integrated with wind energy systems that produce intermittent power. Globally, the power system network develops due to the integration of several private power companies to the national electricity network (PT. PLN). This leads to the violation of stability limits of the system. As a result, voltage instability occurs and incurs high cost for both consumers and companies.

Increasing demand for electricity must be supported by the quality and reliability of the electric power system [1]. PT. PLN is a sole power company which constructs, manages, and maintains the whole Indonesian electric power system on one side and should guarantee the quality of electricity to the consumers on another side [2,3].

Voltage stability as defined by P. Kundur is the ability of a power system to maintain a stable and acceptable voltage on all buses in the system under normal operating conditions and after experiencing a disturbance [4]. It is desired that the power system remains in a state of equilibrium under normal conditions and is expected to react to return the system state to an acceptable state after the disturbance.

The causes of voltage instability are sudden load increase, external factors, and improper operation of the voltage control device. More importantly, voltage instability can arise where there is a mismatch between the reactive power supply and demand, i.e., the inability of the system to meet the reactive power requirements. Voltage instability due to overload on the power network can cause a decrease in system voltage and eventually a voltage collapse occurs. This has severe consequences on system security and jeopardizes essential services to provide customers with reliable and continuous power supply [5].

There are various methods to assess whether a voltage system is stable or not and how close the system is to instability by evaluating voltage stability index. The stability index should be simple and easy to implement in computing to help system planners and operators to examine the condition of voltage stability in the whole electric power system. The stability index can indicate the critical bus of the power system connected between one bus to another. In general, analysis of voltage stability problems in power systems is used to: 1) determine the voltage drop indicator, 2) determine when voltage instability occurs, 3) determine weak buses in the network, and 4) identify areas subjected to unstable systems [6].
