

UNDERSTANDING TYPE 2 DIABETES

Glucose Consumption

Food enters the digestive system as carbohydrates, fats, and proteins. Carbohydrates are broken down into glucose molecules. Glucose can be easily absorbed by the body, released into the bloodstream, and then the pancreas releases it to be absorbed by the blood stream.

Insulin Response

Blood glucose levels throughout the body to provide energy. Increased blood glucose levels signal specialized pancreatic cells to produce the hormone insulin. Insulin is released into the bloodstream, and insulin and glucose travel together throughout the body to be used up by cells for energy.

Insulin Resistance

Insulin attaches to receptors on the surface of cells, which opens glucose channels allowing the uptake of glucose into the cell.

People with type 2 diabetes do not respond to insulin effectively, which is known as insulin resistance. The cell receptors do not allow insulin to bind, or make fewer and more insulin molecules to achieve the same effect. Because glucose is not entering the cell, it remains circulating in the blood stream.

High Levels of Glucose in Blood

If glucose is not used up by the cells for energy or stored by the liver or muscle cells for later use, it remains circulating in the bloodstream. This is why people with type 2 diabetes have high blood glucose levels.

The high levels of glucose in the bloodstream causes damage to the lining of small blood vessels and capillaries. The sustained high glucose causes a higher risk for developing cardiovascular disease, such as atherosclerosis or coronary artery disease.

Complications of Type 2 Diabetes

Diabetic Retinopathy

Diabetes can damage the blood vessels of the retina, potentially leading to blindness. Diabetes also increases the risk of other serious vision problems, such as cataracts and glaucoma.

Stroke

Diabetes increases the risk for cerebrovascular disease (stroke). A stroke occurs when the blood vessels become damaged or blocked, preventing blood from reaching an area of the brain.

Heart Disease

Diabetes increases the risk of cardiovascular problems such as coronary artery disease with chest pain (angina) and heart attack.

Diabetic Nephropathy

Diabetes can damage the small blood vessels of the filtering system of the kidney. Severe damage can lead to kidney failure or irreversible kidney disease.

High Blood Pressure (Hypertension)

Both diabetes and hypertension increase the risk of developing other problems, such as heart attack, stroke, eye problems and kidney disease.

Nerve Damage

Diabetes damages the small blood vessels that nourish your nerves, leading to nerve damage.

Skin Complications

Diabetes can make you more susceptible to skin problems, including bacterial and fungal infections.

Erectile Dysfunction

Elevated blood glucose levels can cause damage to the blood vessels and nerves to the penis which may lead to erectile dysfunction.

Bladder

Diabetes can lead to bladder dysfunction and urinary tract infections.

Hearing Loss

Hearing depends on small blood vessels and nerves in the inner ear. High blood glucose levels can damage these vessels and nerves, affecting the ability to hear.

Gastroparesis

Gastroparesis (delayed stomach emptying) is a digestive problem that is associated with diabetes. It is caused by damage to the vagus nerve, which regulates the digestive system.

Leg / Foot

Diabetes can lead to peripheral artery disease, where blood flow to the leg and foot is decreased.
