Intrinsic Capacitance Parameter Extraction in UTMOST III

Introduction

The intrinsic capacitance parameter extraction routine (INTCAP) is in the CAP analysis section of the *UTMOST III* MOS module (Routine#67). The INTCAP routine has 5 different intrinsic cap measurements and a "simulation only" capability for all intrinsic caps. Recent developments have improved the INTCAP routine. Users should have *UTMOST III* MOS module version 15.2.0 or higher to be able use the examples and explanations presented in this article. The INTCAP routine allows users to measure the MOS capacitances when the device is under DC bias and conducting current.

INTCAP Routine Settings

The intrinsic caps which can be measured using the INTCAP routine are:

CGD, CGS, CGC, CGB and CGG.

The user should select the proper cap using the "Multiple Selection" button located in the "Routine Control" screen for the INTCAP routine. The routine control screen can be opened from the main *UTMOST* screen.

The selected cap buttons will appear in red. It is recommended to select one cap at a time for the measurements until the user is familiar with the entire routine.

CGS (Gate to Source Capacitance)

Hardware Connection:

- Drain -> DC analyzer (Drain terminal)
- Gate -> LCR meter (Low)
- Source -> LCR meter (High) AND DC analyzer (Source terminal)
- Bulk -> DC analyzer (Bulk terminal)

Operation Principals

The LCR meter will supply the SOURCE Voltage. The DC analyzer SOURCE terminal is also connected to the

MOS device SOURCE terminal. However the DC analyzer SOURCE terminal will work as a Voltmeter monitoring the actual SOURCE voltage of the device. The SOURCE voltage needs to be monitored because the LCR meter has an internal shunt resistor at its High terminal and the supplied voltage from the LCR meter and the actual SOURCE voltage are different due to the voltage drop across the LCR meter's shunt resistor. The measured SOURCE Voltage is fed back to *UTMOST* and *UTMOST* iterates the LCR meter voltage source supply until the device SOURCE terminal reaches to the preset VDS value.

The DRAIN terminal of the MOS device is connected to a voltage supply using the DC analyzer. The DRAIN terminal voltage is stepped to provide the initial VDS voltage before the SOURCE voltage iterations start.

The SOURCE will be stepped to provide the actual VGS voltage steps.

The GATE will be grounded by connecting it to the Low terminal of the LCR meter.

Example:

Conditions: $V_{GS}=2V$, $V_{DS}=1V$

Initially the SOURCE voltage (using the LCR meter) is set to -2V to provide $V_{GS}=-2V$. (GATE is grounded)

Utmost Iii Extractions Manual:

Cmos Rf Modeling, Characterization And Applications M Jamal Deen, Tor A Fjeldly, 2002-04-10 CMOS technology has now reached a state of evolution in terms of both frequency and noise where it is becoming a serious contender for radio frequency RF applications in the GHz range Cutoff frequencies of about 50 GHz have been reported for 0.18 μ m CMOS technology and are expected to reach about 100 GHz when the feature size shrinks to 100 nm within a few years This translates into CMOS circuit operating frequencies well into the GHz range which covers the frequency range of many of today's popular wireless products such as cell phones GPS Global Positioning System and Bluetooth Of course the great interest in RF CMOS comes from the obvious advantages of CMOS technology in terms of production cost high level integration and the ability to combine digital analog and RF circuits on the same chip This book discusses many of the challenges facing the CMOS RF circuit designer in terms of device modeling and characterization which are crucial issues in circuit simulation and design
