Using R For Introductory Statistics Second Edition Chapman Hallcrc The R Series:

Using R for Introductory Statistics John Verzani, 2018-10-03 The second edition of a bestselling textbook *Using R for Introductory Statistics* guides students through the basics of R helping them overcome the sometimes steep learning curve The author does this by breaking the material down into small task oriented steps The second edition maintains the features that made the first edition so popular while updating data examples and changes to R in line with the current version See What's New in the Second Edition Increased emphasis on more idiomatic R provides a grounding in the functionality of base R Discussions of the use of RStudio helps new R users avoid as many pitfalls as possible Use of knitr package makes code easier to read and therefore easier to reason about Additional information on computer intensive approaches motivates the traditional approach Updated examples and data make the information current and topical The book has an accompanying package *UsingR* available from CRAN R's repository of user contributed packages The package contains the data sets mentioned in the text data package *UsingR* answers to selected problems answers a few demonstrations demo the errata errata and sample code from the text The topics of this text line up closely with traditional teaching progression however the book also highlights computer intensive approaches to motivate the more traditional approach The authors emphasize realistic data and examples and rely on visualization techniques to gather insight They introduce statistics and R seamlessly giving students the tools they need to use R and the information they need to navigate the sometimes complex world of statistical computing

[A Bayesian Introduction to Fish Population Analysis](#) Joseph E. Hightower, 2025-09-23 Fisheries science is an applied field A biologist working on a depleted population might need to forecast the population trajectory or examine which factors are limiting recovery For an exploited population a biologist might investigate whether the fishery or the stock would be improved through harvest regulation such as a quota or size limit Addressing those sorts of questions generally involves estimating parameters such as population size or survival rate An essential step is characterizing the degree of uncertainty in results which can be substantial for fisheries models Bayesian methods and current software provide a flexible and powerful framework for addressing these challenges Models developed using Bayesian software can be tailored to the unique aspects of each field study A Bayesian Introduction to Fish Population Analysis is aimed at advanced undergraduate and graduate students as well as working professionals interested in a hands on introduction to Bayesian approaches for fitting fisheries models Chapters address key aspects of population dynamics abundance mortality growth and recruitment The book includes complete R code for simulating each study design and JAGS Bayesian code for model fitting code files are also available online No prior knowledge of R or JAGS is assumed and new commands are introduced gradually through the sequence of examples There is emphasis throughout the book on how to vary simulation settings to develop intuition about fisheries models e.g. how many fish should be tagged in order to obtain usefully precise results Additional topics include development of integrated population models model checking model selection and uninformative and informative prior distributions Key features include The book begins with a focus on ecologically relevant probability distributions e.g. binomial Poisson normal lognormal as a foundation for the applied fisheries chapters Subsequent chapters demonstrate Bayesian approaches for estimating abundance mortality growth and recruitment Full open source code is provided for simulation and plotting using R and Bayesian model fitting using JAGS The book demonstrates how simulation can be used to gain a deeper understanding of analytical methods and for planning field studies Joseph E Hightower is a professor emeritus in the Department of Applied Ecology at NC State University His research interests focus on fish population dynamics especially field and analytical methods for estimating population parameters His primary teaching role was a graduate course in quantitative fisheries management including Bayesian methods that serve as the foundation for this book
