Vivo A Semantic Approach To Scholarly Networking And Discovery Mike Conlon:

VIVO Katy Borner, Ying Ding, Mike Conlon, Jon Corson-Rikert, 2022-05-31 The world of scholarship is changing rapidly Increasing demands on scholars the growing size and complexity of questions and problems to be addressed and advances in sophistication of data collection analysis and presentation require new approaches to scholarship A ubiquitous open information infrastructure for scholarship consisting of linked open data open source software tools and a community committed to sustainability are emerging to meet the needs of scholars today This book provides an introduction to VIVO <http://vivoweb.org> a tool for representing information about research and researchers their scholarly works research interests and organizational relationships VIVO provides an expressive ontology tools for managing the ontology and a platform for using the ontology to create and manage linked open data for scholarship and discovery Begun as a project at Cornell and further developed by an NIH funded consortium VIVO is now being established as an open source project with community participation from around the world By the end of 2012 over 20 countries and 50 organizations will provide information in VIVO format on more than one million researchers and research staff including publications research resources events funding courses taught and other scholarly activity The rapid growth of VIVO and of VIVO compatible data sources speaks to the fundamental need to transform scholarship for the 21st century Table of Contents Scholarly Networking Needs and Desires The VIVO Ontology Implementing VIVO and Filling It with Life Case Study University of Colorado at Boulder Case Study Weill Cornell Medical College Extending VIVO Analyzing and Visualizing VIVO Data The Future of VIVO Growing the Community [Publishing and Using Cultural Heritage Linked Data on the Semantic Web](#) Eero Hyvonen, 2022-05-31 Cultural Heritage CH data is syntactically and semantically heterogeneous multilingual semantically rich and highly interlinked It is produced in a distributed open fashion by museums libraries archives and media organizations as well as individual persons Managing publication of such richness and variety of content on the Web and at the same time supporting distributed interoperable content creation processes poses challenges where traditional publication approaches need to be re thought Application of the principles and technologies of Linked Data and the Semantic Web is a new promising approach to address these problems This development is leading to the creation of large national and international CH portals such as Europeana to large open data repositories such as the Linked Open Data Cloud and massive publications of linked library data in the U S Europe and Asia Cultural Heritage has become one of the most successful application domains of Linked Data and Semantic Web technologies This book gives an overview on why when and how Linked Open Data and Semantic Web technologies can be employed in practice in publishing CH collections and other content on the Web The text first motivates and presents a general semantic portal model and publishing framework as a solution approach to distributed semantic content creation based on an ontology infrastructure On the Semantic Web such an infrastructure includes shared metadata models ontologies and logical reasoning and is supported by shared ontology and other Web services alleviating the use of the new

technology and linked data in legacy cataloging systems The goal of all this is to provide layman users and researchers with new more intelligent and usable Web applications that can be utilized by other Web applications too via well defined Application Programming Interfaces API At the same time it is possible to provide publishing organizations with more cost efficient solutions for content creation and publication This book is targeted to computer scientists museum curators librarians archivists and other CH professionals interested in Linked Data and CH applications on the Semantic Web The text is focused on practice and applications making it suitable to students researchers and practitioners developing Web services and applications of CH as well as to CH managers willing to understand the technical issues and challenges involved in linked data publication Table of Contents Cultural Heritage on the Semantic Web Portal Model for Collaborative CH Publishing Requirements for Publishing Linked Data Metadata Schemas Domain Vocabularies and Ontologies Logic Rules for Cultural Heritage Cultural Content Creation Semantic Services for Human and Machine Users Conclusions **Smart**

Citizens, Smarter State Beth Simone Noveck, 2015-11-02 The purpose of Smarter State is to provide both the theory and a practical blueprint for going beyond mere transparency and passive citizenship to a world in which citizenship is active and institutions are open by default Such openness and collaboration are essential if democratic societies are to meet the challenges of today and tomorrow Preface *Semantic Breakthrough in Drug Discovery* Bin Chen, Huijun Wang, Ying Ding, David Wild, 2022-06-01 The current drug development paradigm sometimes expressed as One disease one target one drug is under question as relatively few drugs have reached the market in the last two decades Meanwhile the research focus of drug discovery is being placed on the study of drug action on biological systems as a whole rather than on individual components of such systems The vast amount of biological information about genes and proteins and their modulation by small molecules is pushing drug discovery to its next critical steps involving the integration of chemical knowledge with these biological databases Systematic integration of these heterogeneous datasets and the provision of algorithms to mine the integrated datasets would enable investigation of the complex mechanisms of drug action however traditional approaches face challenges in the representation and integration of multi scale datasets and in the discovery of underlying knowledge in the integrated datasets The Semantic Web envisioned to enable machines to understand and respond to complex human requests and to retrieve relevant yet distributed data has the potential to trigger system level chemical biological innovations Chem2Bio2RDF is presented as an example of utilizing Semantic Web technologies to enable intelligent analyses for drug discovery Table of Contents Introduction Data Representation and Integration Using RDF Data Representation and Integration Using OWL Finding Complex Biological Relationships in PubMed Articles using Bio LDA Integrated Semantic Approach for Systems Chemical Biology Knowledge Discovery Semantic Link Association Prediction Conclusions References Authors Biographies *Semantic Mining of Social Networks* Jie Tang, Juanzi Li, 2022-06-01 Online social networks have already become a bridge connecting our physical daily life with the web based information space This connection produces a

huge volume of data not only about the information itself but also about user behavior The ubiquity of the social Web and the wealth of social data offer us unprecedented opportunities for studying the interaction patterns among users so as to understand the dynamic mechanisms underlying different networks something that was previously difficult to explore due to the lack of available data In this book we present the architecture of the research for social network mining from a microscopic point of view We focus on investigating several key issues in social networks Specifically we begin with analytics of social interactions between users The first kinds of questions we try to answer are What are the fundamental factors that form the different categories of social ties How have reciprocal relationships been developed from parasocial relationships How do connected users further form groups Another theme addressed in this book is the study of social influence Social influence occurs when one's opinions emotions or behaviors are affected by others intentionally or unintentionally Considerable research has been conducted to verify the existence of social influence in various networks However few literature studies address how to quantify the strength of influence between users from different aspects In Chapter 4 and in 138 we have studied how to model and predict user behaviors One fundamental problem is distinguishing the effects of different social factors such as social influence homophily and individual's characteristics We introduce a probabilistic model to address this problem Finally we use an academic social network ArnetMiner as an example to demonstrate how we apply the introduced technologies for mining real social networks In this system we try to mine knowledge from both the informative publication network and the social collaboration network and to understand the interaction mechanisms between the two networks The system has been in operation since 2006 and has already attracted millions of users from more than 220 countries regions

Social Semantic Web Mining Tope Omitola, Sebastián A. Ríos, John G. Breslin, 2022-06-01 The past ten years have seen a rapid growth in the numbers of people signing up to use Web based social networks hundreds of millions of new members are now joining the main services each year with a large amount of content being shared on these networks tens of billions of content items are shared each month With this growth in usage and data being generated there are many opportunities to discover the knowledge that is often inherent but somewhat hidden in these networks Web mining techniques are being used to derive this hidden knowledge In addition the Semantic Web including the Linked Data initiative to connect previously disconnected datasets is making it possible to connect data from across various social spaces through common representations and agreed upon terms for people content items etc In this book we detail some current research being carried out to semantically represent the implicit and explicit structures on the Social Web along with the techniques being used to elicit relevant knowledge from these structures and we present the mechanisms that can be used to intelligently mesh these semantic representations with intelligent knowledge discovery processes We begin this book with an overview of the origins of the Web and then show how web intelligence can be derived from a combination of web and Social Web mining We give an overview of the Social and Semantic Webs followed by a description of the combined Social Semantic

Web along with some of the possibilities it affords and the various semantic representation formats for the data created in social networks and on social media sites Provenance and provenance mining is an important aspect here especially when data is combined from multiple services We will expand on the subject of provenance and especially its importance in relation to social data We will describe extensions to social semantic vocabularies specifically designed for community mining purposes SIOCM In the last three chapters we describe how the combination of web intelligence and social semantic data can be used to derive knowledge from the Social Web starting at the community level macro and then moving through group mining meso to user profile mining micro

Knowledge Graphs Aidan Hogan, Eva Blomqvist, Michael Cochez, Claudia d'Amato, Gerard de Melo, Claudio Gutierrez, Sabrina Kirrane, Jose Emilio Labra Gayo, Roberto Navigli, Sebastian Neumaier, Axel Polleres, Sabbir Rashid, Anisa Rula, Antoine Zimmermann, Lukas Schmelzeisen, Axel-Cyrille Ngonga Ngomo, Juan Sequeda, Steffen Staab, 2022-06-01 This book provides a comprehensive and accessible introduction to knowledge graphs which have recently garnered notable attention from both industry and academia Knowledge graphs are founded on the principle of applying a graph based abstraction to data and are now broadly deployed in scenarios that require integrating and extracting value from multiple diverse sources of data at large scale The book defines knowledge graphs and provides a high level overview of how they are used It presents and contrasts popular graph models that are commonly used to represent data as graphs and the languages by which they can be queried before describing how the resulting data graph can be enhanced with notions of schema identity and context The book discusses how ontologies and rules can be used to encode knowledge as well as how inductive techniques based on statistics graph analytics machine learning etc can be used to encode and extract knowledge It covers techniques for the creation enrichment assessment and refinement of knowledge graphs and surveys recent open and enterprise knowledge graphs and the industries or applications within which they have been most widely adopted The book closes by discussing the current limitations and future directions along which knowledge graphs are likely to evolve This book is aimed at students researchers and practitioners who wish to learn more about knowledge graphs and how they facilitate extracting value from diverse data at large scale To make the book accessible for newcomers running examples and graphical notation are used throughout Formal definitions and extensive references are also provided for those who opt to delve more deeply into specific topics

Incentive-Centric Semantic Web Application Engineering Elena Simperl, Roberta Cuel, Martin Stein, 2022-06-01 While many Web 2.0 inspired approaches to semantic content authoring do acknowledge motivation and incentives as the main drivers of user involvement the amount of useful human contributions actually available will always remain a scarce resource Complementarily there are aspects of semantic content authoring in which automatic techniques have proven to perform reliably and the added value of human and collective intelligence is often a question of cost and timing The challenge that this book attempts to tackle is how these two approaches machine and human driven computation could be combined in order to improve the cost performance ratio of

creating managing and meaningfully using semantic content To do so we need to first understand how theories and practices from social sciences and economics about user behavior and incentives could be applied to semantic content authoring We will introduce a methodology to help software designers to embed incentives minded functionalities into semantic applications as well as best practices and guidelines We will present several examples of such applications addressing tasks such as ontology management media annotation and information extraction which have been built with these considerations in mind These examples illustrate key design issues of incentivized Semantic Web applications that might have a significant effect on the success and sustainable development of the applications the suitability of the task and knowledge domain to the intended audience and the mechanisms set up to ensure high quality contributions and extensive user involvement Table of Contents Semantic Data Management A Human driven Process Fundamentals of Motivation and Incentives Case Study Motivating Employees to Annotate Content Case Study Building a Community of Practice Around Web Service Management and Annotation Case Study Games with a Purpose for Semantic Content Creation Conclusions **Natural Language**

Processing for the Semantic Web Diana Maynard,Kalina Bontcheva,Isabelle Augenstein,2022-05-31 This book introduces core natural language processing NLP technologies to non experts in an easily accessible way as a series of building blocks that lead the user to understand key technologies why they are required and how to integrate them into Semantic Web applications Natural language processing and Semantic Web technologies have different but complementary roles in data management Combining these two technologies enables structured and unstructured data to merge seamlessly Semantic Web technologies aim to convert unstructured data to meaningful representations which benefit enormously from the use of NLP technologies thereby enabling applications such as connecting text to Linked Open Data connecting texts to each other semantic searching information visualization and modeling of user behavior in online networks The first half of this book describes the basic NLP processing tools tokenization part of speech tagging and morphological analysis in addition to the main tools required for an information extraction system named entity recognition and relation extraction which build on these components The second half of the book explains how Semantic Web and NLP technologies can enhance each other for example via semantic annotation ontology linking and population These chapters also discuss sentiment analysis a key component in making sense of textual data and the difficulties of performing NLP on social media as well as some proposed solutions The book finishes by investigating some applications of these tools focusing on semantic search and visualization modeling user behavior and an outlook on the future **The Epistemology of Intelligent Semantic Web Systems**

Mathieu d'Aquin,Enrico Motta,2022-05-31 The Semantic Web is a young discipline even if only in comparison to other areas of computer science Nonetheless it already exhibits an interesting history and evolution This book is a reflection on this evolution aiming to take a snapshot of where we are at this specific point in time and also showing what might be the focus of future research This book provides both a conceptual and practical view of this evolution especially targeted at readers who

are starting research in this area and as support material for their supervisors From a conceptual point of view it highlights and discusses key questions that have animated the research community what does it mean to be a Semantic Web system and how is it different from other types of systems such as knowledge systems or web based information systems From a more practical point of view the core of the book introduces a simple conceptual framework which characterizes Intelligent Semantic Web Systems We describe this framework the components it includes and give pointers to some of the approaches and technologies that might be used to implement them We also look in detail at concrete systems falling under the category of Intelligent Semantic Web Systems according to the proposed framework allowing us to compare them analyze their strengths and weaknesses and identify the key fundamental challenges still open for researchers to tackle
