moist by a glandular secretion and have a muscle arrangement that retracts the middle of the sole. This retraction forms a hollow that is a suction cup of considerable clinging power.

The dental formula of the deciduous teeth is: $i\ 2/2$, $c\ 1/1$, $pm\ 4/4 = 28$; the formula for the permanent teeth is: $i\ 1/2$, $c\ 0/0$, $pm\ 4/4$, $m\ 3/3 = 34$. The single pair of upper incisors grows continuously and is long and curved. The upper incisors are triangular in cross section and semicircular in form; the flattened back surfaces are without enamel and so produce pointed cutting edges. The lower incisors are chisel-shaped; the first pair has three cusps, the second pair only one. There is a wide space between the incisors and the cheek teeth. The milk canines are rarely persistent. From front to rear, the premolars become more like the molars in structure. The molars vary from low-crowned to high-crowned. Each has four roots, and the lower ones bear two crescents, as in the corresponding teeth

of rhinos and horses. The skull is stout and the roof is flattened.

The terrestrial genera (*Procavia* and *Heterohyrax*) inhabit rocky areas, arid scrub, and open grassland, whereas tree hyraxes (*Dendrohyrax*) are usually arboreal and found in forested areas, though in eastern Africa they inhabit lava flows. The elevational range of the family is sea level to 4,500 meters.

Although only *Dendrohyrax* is arboreal, all genera apparently can climb well; *Heterohyrax*, for example, sometimes suns itself in a tree. Hyraxes move quickly and are extremely agile on rugged and steep surfaces, running and jumping with skill and gaining traction by means of specialized foot pads and probably the inner claw on the foot. This claw is apparently also used to groom the hair. Hyraxes travel on the sole of the foot, with the heel touching the ground, or partly on the digits. In their habits the terrestrial forms are similar to the pikas, *Ochotona*, sheltering in colonies of 5 to about
