Mechanistic Approaches to Interactions of Electric and Electromagnetic Fields with Living Systems Martin Blank, E. Findl, 2013-11-11 Although there is general agreement that exogenous electric and electromagnetic fields influence and modulate the properties of biological systems there is no consensus regarding the mechanisms by which such fields operate It is the purpose of this volume to bring together and examine critically the mechanistic models and concepts that have been proposed We have chosen to arrange the papers in terms of the level of biological organization emphasized by the contributors Some papers overlap categories but the progression from ions and membrane surfaces through macromolecules and the membrane matrix to integrated systems establishes a mechanistic chain of causality that links the basic interactions in the relatively well understood simple systems to the complex living systems where all effects occur simultaneously The backgrounds of the invited contributors include biochemistry biophysics cell biology electrical engineering electrochemistry electrophysiology medicine and physical chemistry As a result of this diversity the mechanistic models reflect the differing

approaches used by these disciplines to explain the same phenomena Areas of agreement define the common ground while the areas of divergence provide opportunities for refining our ideas through further experimentation To facilitate the interaction between the different points of view the authors have clearly indicated those published observations that they are trying to explain i e the experiments that have been critical in their thinking This should establish a consensus regarding important observations In the discussion of theories
