

Upper limb traumatic vascular injuries

H. A. HEIS¹, K. E. BANI-HANI¹, M. A. ELHEIS²

Aim. This study aimed to present our experience in the management of upper limb traumatic vascular injuries in Jordan. **Methods.** Data collected retrospectively on 31 consecutive patients diagnosed to have upper extremity traumatic vascular injuries at King Abdullah University Hospital, northern Jordan, between 2001 and 2006. Factors evaluated included demographic data, location of vessels injured, mechanism of injury, associated injuries, treatment, and outcome.

Results. There were 23 males and 8 females with a mean age of 28 years. The majority of the injuries were caused by penetrating wounds, mainly stab wounds in 17 patients (55%). Associated injuries included orthopedic injuries in 14 patients (45%), venous injuries in 11 patients (35.5%), and nerve injuries in 10 patients (32%). Primary anastomosis was possible in 10 patients (32%), whereas 15 patients (48%) required vein interposition grafting. Forearm fasciotomy was performed in one patient. Vascular repair was successful in 30 patients (97%). The amputation rate was 3% (1/31) and the mortality rate was 10% (3/31). The long-term patency rate of revascularized limbs at a median follow-up of 2 years was 96% (27/28).

Conclusion. Excellent results of vascular repairs were obtained. Long-term disability occurred in patients who had associated nerves injuries and orthopedic injuries, which result in impairment of limb function.

Trauma is a large burden on society, with almost 10% of global mortality being attributable to traumatic injury.¹ It is also a disease of the young, mainly affecting people between 15 and 40 years of age.² Uncontrolled bleeding is a leading cause of death in trauma. In civilian and military trauma, exsanguinations accounts for approximately 40% of mortality; vascular trauma is an important component of this problem.^{2,3}

Vascular injuries of the upper extremity are defined as those distal to the lateral border of the first rib, and include the axillary, brachial, radial, ulnar and hand arteries as well as adjacent veins. Severe extremity vascular injuries account for 4-6% of major trauma,⁴ upper extremity vascular injuries constitute nearly one-half of all vascular traumas to the extremities in both civilian and combat series.⁵⁻⁷ Although vascular injuries of the upper extremity are uncommon, yet they are associated with major morbidity and mortality because they may present as a life or limb threatening event. They represent approximately 30% to 50% of all peripheral vascular injuries and constitute about 1% of total trauma workload. The majority of
