

Hydrogeology

Hydrogeology (*hydro-* meaning water, and *-geology* meaning the study of the Earth) is the area of geology that deals with the distribution and movement of groundwater in the soil and rocks of the Earth's crust (commonly in aquifers). The term **geohydrology** is often used interchangeably. Some make the minor distinction between a hydrologist or engineer applying themselves to geology (geohydrology), and a geologist applying themselves to hydrology (hydrogeology).

Introduction

Hydrogeology is an interdisciplinary subject; it can be difficult to account fully for the chemical, physical, biological and even legal interactions between soil, water, nature and society. The study of the interaction between groundwater movement and geology can be quite complex. Groundwater does not always flow in the subsurface down-hill following the surface topography; groundwater follows pressure gradients (flow from high pressure to low) often following fractures and conduits in circuitous paths. Taking into account the interplay of the different facets of a multi-component system often requires knowledge in several diverse fields at both the experimental and theoretical levels. The following is a more

traditional introduction to the methods and nomenclature of saturated subsurface hydrology, or simply hydrogeology.

Hydrogeology in relation to other fields

Hydrogeology, as stated above, is a branch of the earth sciences dealing with the flow of water through aquifers and other shallow porous media (typically less than 450 m or 1,500 ft below the land surface.) The very shallow flow of water in the subsurface (the upper 3 m or 10 ft) is pertinent to the fields of soil science, agriculture and civil engineering, as well as to hydrogeology. The general flow of fluids (water, hydrocarbons, geothermal fluids, etc.) in deeper formations is also a concern of geologists, geophysicists and petroleum geologists. Groundwater is a slow-moving, viscous fluid (with a Reynolds number less than unity); many of the empirically derived laws of groundwater flow can be alternately derived in fluid mechanics from the special case of Stokes flow (viscosity and pressure terms, but no inertial term).

The mathematical relationships used to describe the flow of water through porous media are the diffusion and Laplace equations, which have applications in many diverse fields. Steady groundwater flow (Laplace equation) has been simulated using electrical, elastic and heat conduction analogies. Transient groundwater flow is analogous to the diffusion of heat in a solid, therefore some solutions to hydrological problems have been adapted from heat transfer literature.

Streamflow Measurement, Third Edition Reginald W. Herschy, 2008-06-30 Too little water or too much In either case streamflow measurement is crucial Climate change could significant affect water resources and flood management Streamflow measurement is necessary for efficient water management This third edition deals with all the main current methods for measuring the flow in rivers and open channels in accordance with ISO and CEN standards and to satisfy the current requirements of the International Organization for Standardization and the European Union s Water Directive A new chapter on the Acoustic Doppler Current Profiler ADCP is included the chapter on uncertainties has been redrafted in accordance with the recent International Standard on uncertainties in measurement GUM the chapters on the Stage Fall Discharge method and Hydrometric Data Processing have also been updated and a new section on flood flows has been added

Modeling and Computation in Engineering III Lei Zhang, Liquan Xie, 2014-06-11 The demands of modeling and computation in engineering are rapidly growing as a multidisciplinary area with connections to engineering mathematics and computer science Modeling and Computation in Engineering III contains 45 technical papers from the 3rd International Conference on Modeling and Computation in Engineering CMCE 2014 28 29 June 2014 including 2014 Hydraulic Engineering and Environment Workshop HEEW 2014 The conference serves as a major forum for researchers engineers and manufacturers to share recent advances discuss problems and identify challenges associated with modeling technology simulation technology and tools computation methods and their engineering applications The contributions showcase recent developments in the areas of civil engineering hydraulic engineering environmental engineering and systems engineering and other related fields The contributions in this book mainly focus on advanced theories and technology related to modeling and computation in civil engineering hydraulic structures hydropower and management coastal reclamation and environmental assessment flood control irrigation and drainage water resources and water treatment environmental management and sustainability waste management and environmental protection pollution and control geology and geography mechanics in engineering numerical software and applications Although these papers represent only modest advances toward modeling and computation problems in engineering some of the technologies might be key factors in the success of future engineering advances It is expected that this book will stimulate new ideas methods and applications in ongoing engineering advances Modeling and Computation in Engineering III will be invaluable to academics and professionals in civil engineering hydraulic engineering and environmental engineering
