Djuranovic,2008-10-01 How much influence does the regime type of a country have on its ability to win an international war Upon closer inspection very little A careful study of the process by which peaceful citizens are converted into instruments of state sponsored destruction shows that countries with democratic systems of government perform no better in international wars than their non democratic counterparts Instead it is the size of the population asset that the states leadership can gather leverage and deploy in combat that has historically mattered most for victory in war Population sizes of countries in the international system are so varied that it is virtually impossible for a small nation to withstand the military onslaught of a more populous foe a finding that reintroduces some basic tenets of realism to modern foreign policy discussions The importance of the size and quality of a countrys population is demonstrated via statistical analysis on a novel dataset of international wars since 1816 as well as detailed case studies of the Arab Israeli Wars and German invasion of France in 1940

Managing Safety of Heterogeneous Systems Yuri Ermoliev, Marek Makowski, Kurt Marti, 2012-01-31 Managing safety of diverse systems requires decision making under uncertainties and risks Such systems are typically characterized by spatio temporal heterogeneities inter dependencies externalities endogenous risks discontinuities irreversibility practically irreducible uncertainties and rare events with catastrophic consequences Traditional scientific approaches rely on data from real observations and experiments yet no sufficient observations exist for new problems and experiments are usually impossible Therefore science based support for addressing such new class of problems needs to replace the traditional deterministic predictions analysis by new methods and tools for designing decisions that are robust against the involved uncertainties and risks The new methods treat uncertainties explicitly by using synthetic information derived by integration of hard elements including available data results of possible experiments and formal representations of scientific facts with soft elements based on diverse representations of scenarios and opinions of public stakeholders and experts The volume presents such effective new methods and illustrates their applications in different problem areas including engineering economy finance agriculture environment and policy making

The Economic Psychology of Incentives A.
