Torsion And Shear Stresses In Ships Torsion And Shear Stresses In Ships:

Torsion and Shear Stresses in Ships Mohamed Shama, 2010-09-27 In the last few decades much research work was conducted to improve ship structure analysis and design Most of the efforts were directed to improve the strength of hull girder and to use the method of finite element analysis more efficiently and effectively Because of the high degree of complexity of ship structures the interaction between hull girder strength and local strength require special attention The complex system of stresses could produce unacceptable deformations and high values of equivalent stresses This book covers an area of ship structure analysis and design that has not been exhaustively covered by other books on ship structures in a simple form It presents the basic concepts of the methods and procedures required to calculate torsion and shear stresses in ship structures Moreover it is enhanced with a set of some solved and unsolved problems very useful for students of naval and marine engineering *Design of Ship Hull Structures* Yasuhisa Okumoto, Yu Takeda, Masaki Mano, Tetsuo

Okada, 2009-03-25 In this book the four authors show us the condensed experience how to design ship hull structures from a practical viewpoint In three parts the book presents the fundamentals the theory and the application of structural design of hulls The topics are treated comprehensively with an emphasis on how to achieve reliable and efficient ship structures The authors have in particular introduced their experiences with the rapid increase of ship sizes as well as the introduction of ship types with a high degree of specialization The associated early failures of these new structures have been analyzed to provide the readers with illustrations why structural design needs to be carried out on several levels in order to ensure that correct loading is applied and that local structural behaviour is properly understood Master and Chief Mate International Maritime Organization, 1999 *Advances in Maritime Technology and Engineering* Carlos Guedes Soares, Tiago A.

Santos, 2024-05-08 *Advances in Maritime Technology and Engineering* comprises a collection of the papers presented at the 7th International Conference on Maritime Technology and Engineering MARTECH 2024 held in Lisbon Portugal on 14-16 May 2024 This Conference has evolved from the series of biannual national conferences in Portugal which have become an international event reflecting the internationalization of the maritime sector and its activities MARTECH 2024 is the seventh of this new series of biannual conferences This book comprises 142 contributions that were reviewed by an International Scientific Committee *Advances in Maritime Technology and Engineering* is dedicated to maritime transportation ports as well as maritime safety and reliability It further comprises sections dedicated to ship design cruise ship design and to the structural aspects of ship design such as ultimate strength and composites subsea structures as pipelines and to ship building and ship repair The *Proceedings in Marine Technology and Ocean Engineering* series is dedicated to the publication of proceedings of peer reviewed international conferences dealing with various aspects of Marine Technology and Ocean Engineering The series includes the proceedings of the following conferences the International Maritime Association of the Mediterranean IMAM conferences the Marine Structures MARSTRUCT conferences the Renewable Energies Offshore

RENEW conferences and the Maritime Technology MARTECH conferences The Marine Technology and Ocean Engineering series is also open to new conferences that cover topics on the sustainable exploration of marine resources in various fields such as maritime transport and ports usage of the ocean including coastal areas nautical activities the exploration and exploitation of mineral resources the protection of the marine environment and its resources and risk analysis safety and reliability The aim of the series is to stimulate advanced education and training through the wide dissemination of the results of scientific research Bureau of Ships Journal United States. Navy Department. Bureau of Ships,1961 **Naval Ship Systems Command Technical News** ,1961 *Bureau of Ships Journal* ,1961 *Load and Global Response of Ships* J.J Jensen,2001-08-08 Load and Global Response of Ships gives an introductory background to naval architecture statistics and strength of materials Each subject is treated in detail starting from the first principle The aim of this title was to derive and present the necessary theoretical framework for predicting the extreme loads and the corresponding hull girder stresses that a ship may be subjected to during its operational lifetime Although some account is given to reliability analysis the present treatment has to be supplemented with methods for detailed stress evaluation and for structural strength assessment before a complete structural reliability analysis can be carried out The classification societies have issued rules and regulations for a proper structural analysis of a ship and selection of the scantlings Previously those rules rather explicitly gave formulae for the thickness of the hull platings the size of the stiffeners etc Such empirical rules must necessarily be rather conservative in order to apply to a large variety of ships With the advent of powerful computers the rules have changed Today the naval architect can perform the structural analysis using mainly rational methods based on first principles The classification society may then specify proper safety factors against local global failure modes taking into account the consequences of failure and the analysis procedure used A cruder method of analysis then necessitates a larger safety factor Therefore the effort made by the experienced naval architect to perform a detailed structural analysis will be returned not just by a rational structural arrangement but also often in lower weight of the ship and thus a higher payload throughout the operational lifetime of the ship This analysis has attempted to make explicit one way in which designers limit the design space by creating rules to which they expect users to adhere It is also an attempt to encourage designers to reconsider the rules of use that they have used in their designs so as to reconceptualise potential usage This can help design behaviour where rule use is not blindly followed By making these rules visible it is possible to expose the limitations of current technology and development design solutions that do not restrict use to the normal case of action Rules are useful to designers because they are simplifications of activity Rules encode the normal case and these are simplistic representations of work that are in many cases accurate enough for the purpose of design However encoding behaviour in rules has dangers in that they do not encompass the whole range of behaviours that can be performed Using examples this title shows that being able to break rules means that people are able to engage in a richer more flexible set of actions and therefore more appropriate to

contingency than when they are constrained to a limited range

The History of Theoretical, Material and Computational Mechanics - Mathematics Meets Mechanics and Engineering Erwin Stein, 2013-12-04 This collection of 23 articles is the output of lectures in special sessions on The History of Theoretical Material and Computational Mechanics within the yearly conferences of the GAMM in the years 2010 in Karlsruhe Germany 2011 in Graz Austria and in 2012 in Darmstadt Germany GAMM is the Association for Applied Mathematics and Mechanics founded in 1922 by Ludwig Prandtl and Richard von Mises The contributions in this volume discuss different aspects of mechanics They are related to solid and fluid mechanics in general and to specific problems in these areas including the development of numerical solution techniques In the first part the origins and developments of conservation principles in mechanics and related variational methods are treated together with challenging applications from the 17th to the 20th century Part II treats general and more specific aspects of material theories of deforming solid continua and porous soils and Part III presents important theoretical and engineering developments in fluid mechanics beginning with remarkable inventions in old Egypt the still dominating role of the Navier Stokes PDEs for fluid flows and their complex solutions for a wide field of parameters as well as the invention of pumps and turbines in the 19th and 20th century The last part gives a survey on the development of direct variational methods the Finite Element Method in the 20th century with many extensions and generalizations

Mechanics of Composite Structural Elements Holm Altenbach, Johannes W. Altenbach, Wolfgang Kissing, 2013-11-11 Laminate and sandwich structures are typical lightweight elements with rapidly expanding application in various industrial fields In the past these structures were used primarily in aircraft and aerospace industries Now they have also found application in civil and mechanical engineering in the automotive industry in ship building the sport goods industries etc The advantages that these materials have over traditional materials like metals and their alloys are the relatively high specific strength properties the ratio strength to density etc In addition the laminate and sandwich structures provide good vibration and noise protection thermal insulation etc There are also disadvantages for example composite laminates are brittle and the joining of such elements is not as easy as with classical materials The recycling of these materials is also problematic and a viable solution is yet to be developed Since the application of laminates and sandwiches has been used mostly in new technologies governmental and independent research organizations as well as big companies have spent a lot of money for research This includes the development of new materials by material scientists new design concepts by mechanical and civil engineers as well as new testing procedures and standards The growing demands of the industry for specially educated research and practicing engineers and material scientists have resulted in changes in curricula of the diploma and master courses More and more universities have included special courses on laminates and sandwiches and training programs have been arranged for postgraduate studies
