Financial Derivatives seeks to present financial derivatives in a manner that requires minimal mathematical background. Readers will obtain in a quick and engaging way a working knowledge of the field and a collection of practical working insights. The book is ideal for aspiring young practitioners, advanced undergraduates and masters level students who require a concise and practice led introduction to financial derivatives. Features: Practical insights and modelling skills. Accessible to practitioners and students without a significant mathematical background. Eben Mar holds responsibility for absolute return portfolio management and has been working in the financial markets for the last 33 years. He has also held senior roles in risk management, treasury, derivatives trading and asset management. He has a PhD in Applied Mathematics and is an associate professor in Mathematics and Applied Mathematics at the University of Pretoria in South Africa. He has wide research interests in financial derivatives, asset management and financial markets.

Advances in Credit Risk Modeling and Management Frédéric Vrans, 2020-07-01 Credit risk remains one of the major risks faced by most financial and credit institutions. It is deeply connected to the real economy due to the systemic nature of some banks but also because well managed lending facilities are key for wealth creation and technological innovation. This book is a collection of innovative papers in the field of credit risk management. Besides the probability of default (PD), the major driver of credit risk is the loss given default (LGD). In spite of its central importance, LGD modeling remains largely unexplored in the academic literature. This book proposes three contributions in the field. Ye Bellotti exploits a large private dataset featuring non performing loans to design a beta mixture model. Their model can be used to improve recovery rate forecasts and therefore to enhance capital requirement mechanisms. François uses instead the price of defaultable instruments to infer the determinants of market implied recovery rates and finds that macroeconomic and long term issuer specific factors are the main determinants of market implied LGDs. Cheng Cirillo address the problem of modeling the dependency between PD and LGD using an original urn based statistical model. Fadina Schmidt propose an improvement of intensity based default models by accounting for ambiguity around both the intensity process and the recovery rate. Another topic deserving more attention is trade credit which consists of the supplier providing credit facilities to his customers. Whereas this is likely to stimulate exchanges in general, it also magnifies credit risk. This is a difficult problem that remains largely unexplored. Kanapickiene Spicas propose a simple but yet practical model to assess trade credit risk associated with SMEs and microenterprises operating in Lithuania. Another topical area in credit risk is counterparty risk and all other adjustments such as liquidity and capital adjustments known as XVA. Chataignier Crpey propose a genetic algorithm to compress CVA and to obtain affordable incremental figures. Anagnostou Kandhai introduce a hidden Markov model to simulate exchange rate scenarios for counterparty risk. Eventually Boursicot et al analyzes CoCo bonds and find that they reduce the total cost of debt which is positive for shareholders. In a nutshell, all the featured papers contribute to shedding light on various aspects of credit risk management that have so far largely remained unexplored.
