Hydrometeorology Kevin Sene, 2024-07-05 An award winning text introducing the latest operational hydrometeorological forecasting and warning techniques for flood drought reservoir hydropower irrigation water supply and water pollution applications Hydrometeorology Forecasting and Applications is the latest edition of this award winning book intended for practicing engineers and scientists It also provides useful background for undergraduate and postgraduate courses in engineering earth sciences environmental sciences geography meteorology and hydrology Operational examples include applications from the USA UK the Netherlands Bangladesh and Nepal Throughout there is a focus on end to end warning systems forecast uncertainty and risk based and impact based approaches Hydrological forecasting topics include rainfall runoff flow routing data assimilation forecast verification and ensemble techniques There are also updates to the text on weather radar satellite precipitation estimates hydrometry low cost monitoring numerical weather prediction demand forecasting and dissemination of warnings including the role of social media and citizen science Applications include national and community based flood warning systems flash flood guidance famine and drought early warning systems reservoir operations and surface water debris flow ice jam bathing water and harmful algal bloom alerts Seasonal forecasting land surface and global hydrological models are now discussed in more detail including the opportunities from Big Data and artificial intelligence and a new chapter discusses approaches to predicting the hydrological

impacts of climate change The extensive sets of references have been revised and updated There are few books that have ever attempted to discuss all aspects of hydrometeorology in one volume This one does so From a review of the 1st edition in the Bulletin of the American Meteorological Society Kevin Sene FRGS FRMetS CEng MICE is a scientist and writer with wide experience in flood risk management water resources and hydrometeorology His previous publications include books on flood warning forecasting and emergency response and flash flood forecasting and warning Springer 2008 2013

Precipitation: Advances in Measurement, Estimation and Prediction Silas C. Michaelides, 2008-02-27 Water cycling and the future availability of fresh water resources are immense societal concerns that impact all nations on Earth as it affects virtually every environmental issue Precipitation is also a fundamental component of the weather climate system for it regulates the global energy and radiation balance through coupling to clouds water vapor global winds and atmospheric transport Accurate and comprehensive information on precipitation is essential for understanding the global water energy cycle and for a wide range of research and applications with practical benefits to society However rainfall is difficult to measure because precipitation systems tend to be random in character and also evolve and dissipate very rapidly It is not uncommon to see a wide range of rain amounts over a small area and in any given area the amount of rain can vary significantly over a short time span These factors together make precipitation difficult to quantify yet measurements at such local scales are needed for many hydrometeorological applications such as flood and landslide forecasting Historical multi decadal measurements of precipitation from surface based rain gauges are available over continents but oceans remained largely unobserved prior to the beginning of the satellite era Early visible and infrared satellites provided information on cloud tops and their horizontal extent however wide band microwave frequencies proved extremely useful for probing into the precipitating liquid and ice layers of clouds Flood Warning, Forecasting and Emergency Response Kevin Sene, 2008-08-15 Recent flood events in Europe the USA and elsewhere have shown the devastating impact that flooding can have on people and property Flood warning and forecasting systems provide a well established way to help to reduce the effects of flooding by allowing people to be evacuated from areas at risk and for measures to be taken to reduce damage to property With sufficient warning temporary defences sandbags flood gates etc can also be installed and river control structures operated to mitigate the effects of flooding Many countries and local authorities now operate some form of flood warning system and the underlying technology requires knowledge across a range of technical areas including rainfall and tidal detection systems river and coastal flood forecasting models flood warning dissemination systems and emergency response procedures This book provides a comprehensive account of the flood forecasting warning and emergency response process including techniques for predicting the development of flood events and for issuing appropriate warnings Related topics such as telemetry and information systems and flood warning economics are also discussed For perhaps the first time this book brings together in a single volume the many strands of this interesting multidisciplinary topic and will serve as a

reference for researchers policy makers and engineers The material on meteorological hydrological and coastal modelling and monitoring may also be of interest to a wider audience

Mountain Weather Research and Forecasting Fotini K. Chow,Stephan F.J. De Wekker,Bradley J. Snyder,2012-08-30 This book provides readers with a broad understanding of the fundamental principles driving atmospheric flow over complex terrain and provides historical context for recent developments and future direction for researchers and forecasters The topics in this book are expanded from those presented at the Mountain Weather Workshop which took place in Whistler British Columbia Canada August 5 8 2008 The inspiration for the workshop came from the American Meteorological Society AMS Mountain Meteorology Committee and was designed to bridge the gap between the research and forecasting communities by providing a forum for extended discussion and joint education For academic researchers this book provides some insight into issues important to the forecasting community For the forecasting community this book provides training on fundamentals of atmospheric processes over mountainous regions which are notoriously difficult to predict The book also helps to provide a better understanding of current research and forecast challenges including the latest contributions and advancements to the field The book begins with an overview of mountain weather and forecasting challenges specific to complex terrain followed by chapters that focus on diurnal mountain valley flows that develop under calm conditions and dynamically driven winds under strong forcing The focus then shifts to other phenomena specific to mountain regions Alpine foehn boundary layer and air quality issues orographic precipitation processes and microphysics parameterizations Having covered the major physical processes the book shifts to observation and modelling techniques used in mountain regions including model configuration and parameterizations such as turbulence and model applications in operational forecasting The book concludes with a discussion of the current state of research and forecasting in complex terrain including a vision of how to bridge the gap in the future

Flash Floods Kevin Sene,2012-12-14 Flash floods typically develop in a period a few hours or less and can arise from heavy rainfall and other causes such as dam or flood defence breaches and ice jam breaks The rapid development often associated with a high debris content can present a considerable risk to people and property This book describes recent developments in techniques for monitoring and forecasting the development of flash floods and providing flood warnings Topics which are discussed include rainfall and river monitoring nowcasting Numerical Weather Prediction rainfall runoff modelling and approaches to the dissemination of flood warnings and provision of an emergency response The book is potentially useful on civil engineering water resources meteorology and hydrology courses and for post graduate studies but is primarily intended as a review of the topic for a wider audience
