circuit does not include air correction and on 32 DFE and 32 DFM types the circuit emerges directly above the secondary nozzle.

DPV, DPAV, DGV and DPAV carburetors are also equipped with a full power valve which operates immediately the primary throttle valve is opened quickly. Under these conditions the vacuum through channel (7) is insufficient to draw the diaphragm (4) against the spring (6) and the operating rod (16) therefore opens the full power valve (17). The fuel level in the primary emission tube well (14) immediately rises and the mixture drawn from the nozzle (9) is enriched. When the

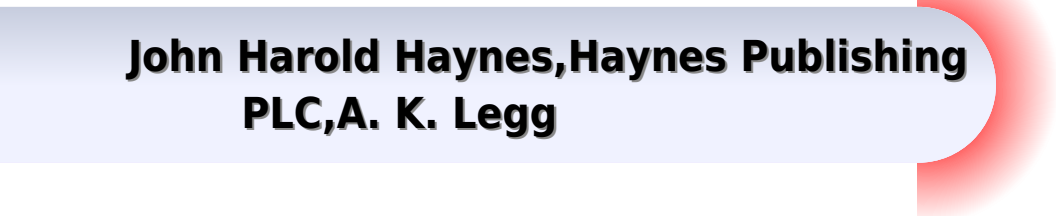

primary throttle valve is partially open, the vacuum through channel (7) overcomes the tension of the spring (6) and the full power valve shuts.

Acceleration

To provide the engine with a rich mixture when accelerating, the carburetor is provided with a diaphragm type acceleration pump which is operated by the primary throttle shaft and injects only into the primary venturi. Reference to Fig. 7.7 will show that when the primary throttle valve is closed, the accelerator pump diaphragm (48) draws fuel from the float
