Weed And Crop Resistance To Herbicides:

Weed and Crop Resistance to Herbicides R. De Prado, J. Jorrín, L. García-Torres, 2012-12-06 In recent decades repeated use of herbicides in the same field has imposed selection for resistance in species that were formerly susceptible On the other hand considerable research in the private and public sectors has been directed towards introducing herbicide tolerance into susceptible crop species The evolution of herbicide resistance understanding its mechanisms characterisation of resistant weed biotypes development of herbicide tolerant crops and management of resistant weeds are described throughout the 36 chapters of this book It has been written by leading researchers based on the contributions made at the International Symposium on Weed and Crop Resistance to Herbicides held at Córdoba Spain This book will be a good reference source for research scientists and advanced students

Herbicide Resistance in Weeds and Crops

Zvonko Pacanoski, 2017-10-04 Herbicides are the dominant technology and the most effective weed control tools ever developed that are used for the control of weeds that infest crops Over the last several decades in situations of intense herbicide usage there have been many examples of the evolution of weed populations resistant to herbicides Weed adaptations to management tactics including biochemical mimicry in the form of evolved resistance to the herbicides used for weed control have increased rapidly throughout agriculture and now threaten global food security Nowadays expended space of research activities remains to focus on the herbicide resistance to weeds and crops The authors of *Herbicide Resistance in Weeds and Crops* cover various issues regarding the present relevant research

Molecular Biology of Weed Control Jonathan Gressel, 2002-03-28 *Molecular Biology of Weed Control* assesses the impact of the new tools of molecular biology on the science of weed control as well as the ways in which the science of weed control has helped and influenced molecular biology. Accentuating the utility of molecular biology to contribute to the control of intransigent weed species both in the developing and developed world, the book also looks to the future and describes how molecular biology can be used to diminish the use of chemical herbicides and enhance crop competitiveness for light, nutrients, and water. This volume is essential reading for all weed scientists, environmental students, researchers, and regulators.

The Impacts and Management of Herbicide-resistant Weeds in Ohio Agronomic Crop Production Alyssa Irene Essman, 2022 Weed management is one of the most important considerations in agronomic crop production. Herbicide resistance in weed populations is a persistent and relevant threat to cropping systems in Ohio, the US, and worldwide. Four studies were conducted from 2018 through 2022 with the following objectives: 1. determine the effects of rye seeding rate, rye management program, and residual herbicide use on cover crop weed and soybean parameters; 2. evaluate the effects of cover crop selection, establishment method, and residual herbicides on cover crop weed and soybean parameters; 3. determine the effects of sublethal rates of growth regulator herbicides on vegetative and reproductive parameters of hemp; and 4. determine the response of Ohio *Amaranthus* populations to relevant herbicide site of action groups in order to monitor herbicide tolerance within Ohio. A field study was repeated in time thrice from 2018 through 2021 in South Charleston, Ohio, to evaluate rye seeding rate, rye management program, and residual herbicide use on cover crop weed and soybean parameters. These data suggested that adjusting the rye management program, which involved different termination timings and herbicide applications, may have more of an effect on weed suppression than adjustments to rye seeding rate. A spring-applied residual and postemergence herbicides were still needed to provide weed control adequate for crop production. Termination of rye after soybean planting can aid in the suppression of weeds, and the impact on soybean yield likely varies with environmental conditions. Data from a second study that evaluated the effects of cover crop selection, establishment method, and residual herbicides on cover crop weed and soybean parameters suggested that biomass varied between broadcast-seeded and drill-seeded cover crops, which influenced their efficacy as a weed management strategy and were most effective when used with comprehensive herbicide programs. The third study involved two trials conducted from 2020 through 2022 in a greenhouse and growth chamber to evaluate sublethal rates of 2,4-D and dicamba on hemp vegetative and reproductive parameters. The results of these trials suggested that hemp may be more sensitive to dicamba than 2,4-D and that plants exposed to sublethal rates of either herbicide in the early vegetative stage may not have distinguishable effects at harvest. The fourth study consisted of a greenhouse herbicide screen conducted for *Amaranthus* samples collected in the fall from 2018 through 2021. Some level of resistance to each herbicide at the 1x rate was exhibited by at least one population each year. Tolerance to

more than one site of action group was present in several populations These results suggest that management and prevention of herbicide resistance in Ohio Amaranthus populations should continue to be a priority for Ohio soybean growers These studies suggested that cover crops were a valuable tool for use in weed suppression but chemical tactics were necessary for acceptable weed control Judicious use of herbicides will be required to deal with the current herbicide resistance issues within Ohio weed populations mitigate risks to potentially sensitive crops and the prevention of resistance development should be a priority
