most common standards for the exchange of information. However, organizations find challenges in how to address the complexities of dealing with hierarchical data types, particularly as they scale to gigabytes and beyond. In this IBM Redbooks publication, we discuss and describe the new capabilities in IBM InfoSphere DataStage 8.5. These capabilities enable developers to more easily manage the design and processing requirements presented by the most challenging XML sources. Developers can use these capabilities to create powerful hierarchical transformations and to parse and compose XML data with high performance and scalability. Spanning both batch and real time run times, these capabilities can be used to solve a broad range of business requirements. As part of the IBM InfoSphere Information Server 8.5 release, InfoSphere DataStage was enhanced with new hierarchical transformation capabilities called XML Stage, which provides native XML schema support and powerful XML transformation functionality. These capabilities are based on a unique state-of-the-art technology that allows you to parse and compose any complex XML structure from and to a relational form as well as to a separate hierarchical form. This book is targeted at an audience of systems designers and developers who focus on implementing XML integration support in their environments.

Advanced Applications and Structures in XML Processing: Label Streams, Semantics Utilization and Data Query Technologies Li, Changqing, Ling, Tok Wang, 2010-02-28. This book is for professionals and researchers working in the field of XML in various disciplines who want to improve their understanding of the XML data management technologies such as XML models, XML query and update processing, XML query languages and their implementations. Keywords: search in XML documents, database web service, publish/subscribe, medical information science and e-business. Provided by publisher.

XML-based Data Integration for Application Interoperability Yunsong Zhan, 2002. The emerging application-to-application paradigm allows an organization's data to be shared across applications in both intra-enterprise and inter-enterprise contexts. In order to seamlessly integrate information from disparate heterogeneous and multi-organizational applications and quickly adapt to new application contexts, rigid information modeling and proprietary data representation technology have proven inadequate. Conventional data integration approaches are based on database systems that represent data semantics using static structured data schemas. They cannot provide adequate facilities to satisfy the increasing need for effective and efficient application data integration from heterogeneous data sources. Applications need to be built on an information model that is standards-based, flexible, and adaptable. This research proposes a framework that adopts a semi-structured data integration approach using a data view mechanism and XML and XPath standards. A prototype of the framework is designed and implemented using a loosely coupled mediator/agent/adaptor architecture based on distributed component technology. An XML query language provides the basis for data view definition as well as query specification and transformation. A denotational semantics and an abstract syntax of the query language are defined here to provide a formal basis for implementation of query processing and logical query optimization. The mapping between the concrete XML syntax and the abstract syntax of the query language is defined to facilitate

implementation of query processing The XMark benchmark for XML databases is used to assess the functionality and performance of the prototyped implementation of the query language and system The benchmarking result and analysis establish a base line query performance measure for the proposed data integration framework and identify the characteristics of different system implementations **XML Databases and the Semantic Web** Bhavani
