**Investing in Quality** Michael T. Buelsing,2016 The quality of Caterpillar s welds is becoming increasingly important as their equipment is made leaner with the goals of increased performance lighter weight and lower unit cost Due to the inherently variable nature of arc welding non destructive weld evaluation is critical to ensure that welding processes remain

in control and that defective parts are quarantined and repaired before being released downstream The conventional ultrasonic weld inspection technology in use at present has several limitations Areas within common joint configurations cannot be adequately inspected due to geometry constraints Discontinuity evaluation requires subjective real time human interpretation by highly trained operators The data produced by the instrumentation is un conducive to recording for off line analysis Imprecise defect sizing leads to Type I and Type II inspection errors the unnecessary rework of good parts and the inappropriate release of non complying parts This project addressed these limitations of conventional ultrasonic weld inspection by identifying and evaluating alternative commercially available technologies and by initiating the internal development of specific proprietary technologies tailored to Caterpillar s needs Through collaboration with Caterpillar s non destructive evaluation NDE community as well as outside vendors a technology known as phased array was selected and validated in the laboratory and production environments Although phased array was not new to Caterpillar its adoption within the production facilities had previously been limited
