Plant Diversification Driven by Genome and Chromosome Evolution and Its Reproductive and Environmental Correlates

Marcial Escudero, Enrique Maguilla, Angelino Carta, Santiago Martín-Bravo, Carmen Benítez Benítez, 2025-10-29 Chromosome genome evolution is known as a major driver of diversification in eukaryotes particularly in plants At the macroevolutionary level chromosome genome evolution has been correlated with diversification rates whereas on a microevolutionary scale with population differentiation Moreover they have been linked with shifts in both ecological niches and reproductive systems across lineages However the precise mechanisms under these apparent correlations remain largely unexplored In this Research Topic our objective is to study the impact of chromosome and genome evolution on diversification patterns in plants Specifically we aim to disentangle the mechanisms through which chromosome and genome evolution may i be related to different ecological scenarios biogeographic changes environmental shifts changes in plant animal interactions including pollinator community etc ii influence crucial plant traits associated with reproductive strategies and iii elucidate how the combination of these intrinsic traits and extrinsic constraints may explain patterns of diversification in plants By integrating macro and microevolutionary perspectives we aim to provide an ecological and evolutionary synthesis that addresses the current knowledge gap in the transition from both evolutionary scales We welcome submissions of original research reviews and method articles We encourage authors to submit their research on the impact of genome chromosome evolution in relation to the following factors Diversification rates Speciation Biogeography Phylogeography Niche evolution Reproductive biology The integration of macro and microevolutionary perspectives
