Medvedeva, Yuzo Shigesato, 2011-11-28 Low cost high performance transparent conducting oxides are of great interest for reduced cost optoelectronics while amorphous oxides of ranging conductivity have attracted attention for interface modification transistor and other technological applications The basic material and physical properties are still being illuminated in these oxide systems even as they become integral in a number of optoelectronic devices Symposium MM Transparent Conducting Oxides and Applications held during the November 29 December 3 2010 MRS Fall Meeting in Boston Massachusetts discussed the basic materials issues in transparent oxide systems such as structure doping carrier transport and optical properties These topics along with the development of solutions and other novel deposition techniques for development of these materials and process related properties were covered This volume includes a cross section of the research on basic materials properties and the technological applications of these materials covered during the symposium Oxide-based Materials and Devices IV, 2013 **Oxide-Based Materials and Devices VIII** Ferechteh H. Teherani, 2017 *Transparent oxides for flexible electronics* Danjela Kuščer, 2009 *Novel Transparent Composite Electrodes and Mixed Oxide Layers for Improved Flexible Electronics* Aritra Dhar, 2015 Transparent conductive oxides TCO comprise a class of materials that exhibit unique combination of high transparency in the visible region along with high electrical conductivity TCOs play an important role as transparent electrodes for optoelectronic devices such as solar cell panels liquid crystal displays transparent heat mirrors and organic light emitting devices OLED The most commonly used transparent electrodes in optoelectronic applications is

indium tin oxide ITO due to its low resistivity $10^{-4} \Omega \text{ cm}$ and high transmittance 80 %. However the limited supply of indium and the growing demand for ITO make the resulting fabrication costs prohibitive for future industry. Thus cost factors have promoted the search for inexpensive materials with good electric optical properties. The object of this work is to study the structure property processing relationship and optimize a suitable transparent electrode with the intent to optimize them for flexible optoelectronics applications. The work focuses on improved processing of the mixed oxide indium gallium zinc oxide IGZO thin films for superior optical and electrical properties. The study focuses on two different methods of post deposition annealing microwave and conventional. The microwave annealing was seen to have the dual advantage of reduced time and lower temperature as compared to conventional annealing. Another work focuses on an indium free transparent composite electrode TCE where a very thin metal layer is inserted between the two TCO layers. A novel $\text{Nb}_2\text{O}_5/\text{Ag}/\text{Nb}_2\text{O}_5$ multilayered structure can exhibit better electrical and optical properties than a single layered TCO thin film. The focus for low cost alternative leads to a $\text{TiO}_2/\text{metal}/\text{TiO}_2$ based TCE. A systematic study was done to understand the effect of metal thickness and substituting different metals Ag, Cu or Au on the opto electrical properties of the TCEs. The $\text{TiO}_2/\text{Ag}/\text{TiO}_2$ with mid Ag thickness 9.5 nm has been optimized to have a sheet resistance of $5.7 \Omega/\text{sq}$ average optical transmittance of 90 % at 550 nm and figure of merit with $61.4 \times 10^3 \Omega^{-1}$. The TCEs showed improved optical and electrical properties when annealed in forming gas and vacuum. These dielectric metal dielectric multilayer TCEs have lower total thickness and are more efficient than a single layer ITO film.
