Understanding GPS, 1996 [Principles of Integrated Maritime Surveillance Systems](#) A. Nejat Ince, Ercan Topuz, Erdal Panayirci, Cevdet Isik, 2012-12-06 Information is always required by organizations of coastal states about the movements identities and intentions of vessels sailing in the waters of interest to them which may be coastal waters straits inland waterways rivers lakes or open seas This interest may stem from defense requirements or from needs for the protection of off shore resources enhanced search and rescue services deterrence of smuggling drug trafficking and other illegal activities and or for providing vessel traffic services for safe and efficient navigation and protection of the environment To meet these needs it is necessary to have a well designed maritime

surveillance and control system capable of tracking ships and providing other types of information required by a variety of user groups ranging from port authorities shipping companies marine exchanges to governments and the military Principles of Integrated Maritime Surveillance Systems will be of vital interest to anyone responsible for the design implementation or provision of a well designed maritime surveillance and control system capable of tracking ships and providing navigational and other types of information required for safe navigation and efficient commercial operation Principles of Integrated Maritime Surveillance Systems is therefore essential to a variety of user groups ranging from port authorities to shipping companies and marine exchanges as well as civil governments and the military

Misra,2014-01-01 The first edition of Fundamentals of Cartography was published in 1969 by Prasaraunga University of Mysore It was reprinted by the Concept Publishing Company New Delhi in While the book remained in currency the cartographic processes changed drastically when information technology brought a sea of change in the sources of information drafting of maps and printing processes Drawing maps by hand became obsolete surveying whether ground or aerial was no longer the only major source of information In view of these changes it became necessary to bring out a new edition Realising that unless one knows directions scales projections coordinates ground and air surveys one would fail to understand the proper use of modern information technology in the drawing the maps Thus the contents of 1969 edition are retained and new chapters have been added to update the book In Part II of the book a chapter on Remote Sensing and Satellite Imageries has been added and Part V contains chapters on Computer Aided Cartography Geographic Information System GIS Land Information System LIS and Global Positioning System GPS

AI-Driven Volunteer Selection Jesko Elsner,2015-03-03 In case of medical emergency situations a Volunteer Notification System aims to alarm potential helpers who can arrive at the victim fast enough to provide cardiopulmonary resuscitation until the professional EMS arrive on scene A simplistic solution for selecting the corresponding volunteers is described by a so called notification radius i e alarming any volunteer with a geographic location that is within a maximum distance from the victim Whilst the actual geographical distance is an important parameter to be

considered this work will illustrate that various additional decision parameters are of importance and elaborate an AI driven volunteer selection system to increase the reliability and efficiency of occurring notifications

Cyclostationarity: Theory and Methods Fakher Chaari, Jacek Leśkow, Antonio Napolitano, Andrea Sanchez-Ramirez, 2014-01-16 In the last decade the research in signal analysis was dominated by models that encompass nonstationarity as an important feature This book presents the results of a workshop held in Grodek Poland in February 2013 which was dedicated to the investigation of cyclostationary signals Its main objective is to highlight the strong interactions between theory and applications of cyclostationary signals with the use of modern statistical tools An important application of cyclostationary signals is the analysis of mechanical signals generated by a vibrating mechanism Cyclostationary models are very important to perform basic operations on signals in both time and frequency domains One of the fundamental problems in diagnosis of rotating machine is the identification of significant modulating frequencies that contribute to the cyclostationary nature of the signals The book shows that there are modern tools available for analyzing cyclostationary signals without the assumption of gaussianity Those methods are based on the ideas of bootstrap subsampling and Fraction of time FOT models The book is organised in two parts The first part will be dedicated to pure theory on cyclostationarity Applications are presented in the second part including several mechanical systems such as bearings gears with or without damages
