

Understanding Prostate Cancer

Signs and Symptoms

Many men with prostate cancer do not have any symptoms when they are diagnosed. The symptoms listed below may also be caused by other conditions.

- **New onset of erection difficulties**
- **Urinary problems:** frequent urination, weak urine flow or need to strain to empty the bladder, urine flow that starts and stops, pain or burning sensation during urination (less common)
- **Pain or discomfort when sitting** (due to an enlarged prostate)

Screening

How is it done?

- **PSA test:** This blood test measures the level of prostate-specific antigen (PSA). An elevated PSA level has been linked to future development of prostate cancer. PSA levels also may be increased for causes not related to cancer.

- **Digital rectal exam (DRE):** A doctor inserts a gloved finger into the rectum to feel the size of the prostate through the wall of the bowel.

Who should be screened? Many prostate cancers grow very slowly and many people with prostate cancer die from other causes. It is not clear in all cases whether the benefits of screening outweigh the harms. Men should discuss their individual risk factors with their doctors to decide whether to have screening.

What is Prostate Cancer?

Prostate cancer is cancer of the walnut-sized gland of a man's reproductive system that makes part of the seminal fluid, which carries sperm out of the body.

Risk Factors

- **Age:** The risk of prostate cancer increases with age. More than one-half of prostate cancer cases are diagnosed in men older than age 65.
- **Family history:** About 20% of prostate cancer cases are caused by genetic changes passed down in families.
- **Race or ethnicity:** Black men and men of African ancestry in the United States are more likely to develop prostate cancer and to die from it than white men.
- **Geographic location:** There is a higher incidence of prostate cancer in men residing in North America and Northern Europe.

Diagnosis

If results of a PSA test or DRE are abnormal, additional tests may be done:

Transrectal ultrasound (TRUS): A probe is inserted into the rectum to determine the exact size and location of the abnormal area.

Transrectal biopsy: Tissue is removed with a needle inserted through the rectum to look for cancer cells.

MR fusion biopsy: MRI and ultrasound images are combined to precisely define the areas for biopsy.

Other imaging tests such as a bone scan, CT scan, or PET may be performed to see if the cancer has spread to other parts of the body.

Gleason Score and Grade Group

The Gleason score and Grade Group are used to grade how likely it is that the cancer will grow.

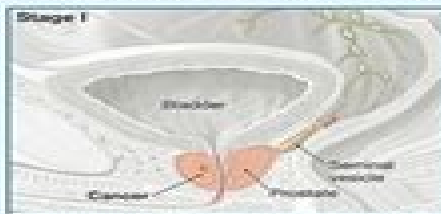

Gleason Score: A pathologist looks at the histologic pattern of cells (how they are arranged) from a biopsy under a microscope at two different locations and assigns them a score (see the table below). Normal-appearing cells are given a low score. Cells that look like cancer are given a higher score. The scores are added together to get a Gleason score of between 6 and 10.

Grade Group: The Gleason score and pattern scores from the two most common areas of cancer are combined into a Grade Group. Lower-grade cancers grow more slowly than higher-grade cancers.

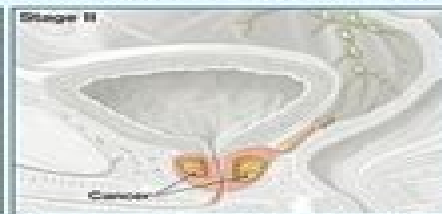

Prognostic Staging

The cancer stage is based on the size and spread of the tumor, the PSA level, and the Grade Group.

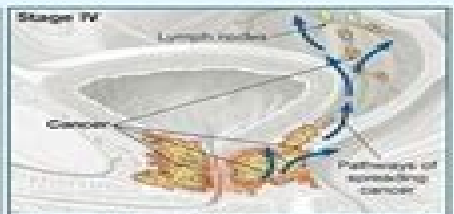

The cancer is not felt during a DRE but found when doing a biopsy for increased PSA, or surgery for another reason. It is located only in one-half or 1 side of the prostate. It is usually slow-growing. The cells look like healthy cells.

The tumor is small (found in one-half of 1 side of the prostate) or larger (can be felt on DRE), but it is still found only in the prostate. PSA levels are medium or low. There is an increasing risk that the tumor will grow and spread.

The tumor is growing and PSA levels or Grade Group is higher than Stage II, or the cancer has spread outside the prostate, perhaps to the seminal vesicles, but not to the lymph nodes.

The cancer has spread to nearby muscles, organs, lymph nodes, or other parts of the body.

Treatments

Treatment depends on a number of factors such as the PSA level, the Grade Group, and whether the cancer has spread. The patient's age, symptoms, and general health are also considered.

Common treatment options include:

Surgery: Removal of the prostate is called a prostatectomy. It can include removal of all or part of the prostate gland. Surgical options include "open" surgery and laparoscopy with robotic assistance.

Radiation therapy: External radiation treatment uses a high-powered X-ray machine outside the body to kill cancer cells. Internal radiation is given with small radioactive "seeds" implanted inside the prostate tissue.

Hormone therapy: Medication is used to stop or block the production of male sex hormones that stimulate the growth of cancer cells.

Targeted therapy: Drugs that target cancer cells' genes or proteins are used to block the growth of cancer cells while sparing healthy cells.

Immunotherapy: A "vaccine" against prostate cancer immune targets may be an option for some people with advanced prostate cancer.

Active surveillance: Close monitoring with periodic PSA tests and DRE is an option for people with cancer that has not spread beyond the prostate and with a Gleason score below 8.

"Watchful waiting": Older patients with serious health conditions or a short life expectancy from other causes may forgo monitoring and any treatments, although radiation may be done if symptoms occur.
