

Volcanoes: Fire Under the Surface

by Kelly Hashway

Have you ever dropped a sealed bottle of soda and then tried to open it? The pressure inside the bottle combined with the carbonation of the soda makes it come shooting out of the opening, much like an erupting volcano.

A volcano is a mountain that opens inward to molten rock below the earth's surface. This molten rock is also called magma, and it is found in the layer of earth known as the mantle. The temperature in the mantle is extremely high. Because heat rises, the magma tries to find a way to rise to the earth's surface. Since the magma is escaping from a small space, it releases a lot of energy. This energy can produce gas and dust, but it also causes pressure to build. The magma rises and shoots out the opening of the volcano, just like a soda that's been shaken.

Not all eruptions are the same. Some volcanoes erupt with lava and others erupt with hot ash. This is because volcanoes come in different shapes and sizes.

- **Ash and cinder volcanoes** have steep sides but aren't very tall. When they erupt, small solid fragments of rock and ash come out of the volcano.
- **Acid lava cone volcanoes** are full of magma, which we call lava once it reaches the surface. These volcanoes erupt with very slow moving, thick lava that doesn't travel far. As the lava cools and hardens, it forms new soil and rock, giving the volcano its cone shape.
- **Shield volcanoes** are also made of hardened lava. When they erupt, their lava flows are very thin and runny. The lava spreads out and becomes new soil, making these volcanoes very large with gentle sloping sides.
- **Composite cone volcanoes** are the most common. They are very tall, and they erupt with runny lava followed by explosive thick lava. They also have a lot of ash. These volcanoes have very steep sides because the ash and thick lava cools and becomes part of the surface.
