Neurological Rehabilitation, 2/e Janet H. Carr, Roberta B. Shepherd, 2011-07-06 Janet Carr and Roberta Shepherd head up a new team of eminent authors for the second edition of this definitive text on neurological physiotherapy In the first edition the authors described a model of neurological rehabilitation for individuals with motor dysfunction based on scientific research in the areas of neuromuscular control biomechanics motor skill learning and the link between cognition and action together with developments in pathology and adaptation The new edition continues to advance this model while identifying and incorporating the many advances that have occurred in the last decade in the understanding and treatment of adults with neurological conditions whether caused by accident or disease Among these advances is the knowledge that the brain retains a plastic potential to reorganize even in old and or lesioned brains and that neural plasticity can be influenced by task related mental and physical practice in a stimulating environment There is also an increasing body of knowledge related to the musculoskeletal system s adaptability and the need to prevent length and stiffness related changes in muscle contractility together with loss of aerobic fitness and endurance There is an expanding body of clinical research that appears to support the model provided here The training guidelines outlined in Neurological Rehabilitation are

based on biomechanical constructs and motor relearning research applied to enhance brain reorganization and muscle contractility and encourage functional recovery of the patient. It connects science and clinical practice enabling students and practitioners to develop their knowledge and use new clinical methods based on modern scientific understanding. All chapters have been revised, some with the collaboration of five specialists who are engaged in high level scientific research and clinical practice. Biomechanical models are presented to provide a framework for action specific training and exercise to improve performance. Clinical guidelines are science and evidence based. Emphasis is on new approaches to the delivery of neurological rehabilitation that increase the time spent in mental and physical activity and the intensity of practice and exercise. Merrill's Atlas of Radiographic Positioning and Procedures Volume 2 E-Book **Total Knee Replacement** Richard S. Laskin, 2012-12-06
Knee replacement can be regarded as the inevitable sequel to hip replacements. The child, so to speak, of a brilliant father. As with other children, there were growing pains and a somewhat troubled adolescence, but the mature adult can now stand proud and unashamed alongside its distinguished forebear. Total replacement of the knee is now a highly successful operation which has enriched the lives of countless sufferers. Clearly, the time is ripe for a definitive work on the subject. Richard Laskin, whose abiding interest and profound knowledge of knee replacement are well known, has gathered together a team of notable experts who between them cover every aspect of the subject. The first section of this book deals with the history of knee replacement, its indications, alternative procedures, biomechanics and materials. Then follows a most

important section by Laskin himself on the surgical technique the details of which as he points out in his preface are more important than differences between the various prostheses The third section considers the results of several different prostheses and discusses some problem areas This is a book which surgeons in the field of knee replacement have been waiting for those with experience will find it of absorbing interest and those who have more recently embarked on the subject will find it an invaluable guide in their quest for perfection Dr Laskin is to be congratulated on his choice of collaborators and for producing such a masterly compilation
