Estimating Link Travel Time on I-70 Corridor Sarosh I. Khan, Kittichai Thanasupsin, 2000 This report represents the findings of a study that demonstrates the feasibility of estimating link travel time and speed in real time for rural mountainous sections of interstate freeway in Colorado using vehicles instrumented with global positioning system GPS receivers serving as probes in traffic streams The system configuration developed includes a cost effective portable GPS deployment unit communication links to a server PC and an integrated prototype system for vehicle tracking and estimating link travel time statistics This study was carried out in two phases The objective of the first phase was to identify a cost effective means of monitoring traffic within a rural mountainous stretch of the I 70 freeway An algorithm was developed to estimate average link speed travel time and the standard error of estimates to provide user information on the reliability of the estimates based on the probe data The algorithm was tested for different traffic conditions and geometric characteristics of links In the second phase of the project a real time demonstrational prototype was developed to receive process and estimate link travel time and speed statistics in real time The system was tested off line and on line based on field data

received from the I 70 corridor In addition GPS receivers were deployed using a commercial vanpool service and the system was evaluated further

Johnson,Denisa Maria Berbece,2025-10-31 Climate change is drastically altering the composition and abundance of seaweed dominated ecosystems throughout our oceans Ocean warming both gradual temperature increases and intensifying marine heatwaves ocean acidification and deoxygenation all can impact the physiology of seaweeds and the ecological roles that they play Ocean warming can cause the long term shift in ranges of seaweed species usually in the form of range retractions at warm edges and range expansions at cool edges of the range Marine heatwaves can elicit acute heat stress in seaweeds drive subsequent mortality and result in phases shifts from one ecosystem type to another Ocean acidification causes the slow transformation of ecosystems from those dominated by coralline algal substrate to those characterised by a variety of turfing seaweeds or microalgae Increasing intensity of ocean deoxygenation and frequency of acute localized events will likely exacerbate the effects of localized threats but effects of deoxygenation remain poorly understood compared to other climate change linked stressors Additionally increased sedimentation caused by land use changes and increased storm frequencies brought on by climate change termed

coastal darkening is also an important stressor of seaweed communities and can interact other stressors e.g. temperature or act on its own to alter the composition and distribution of seaweed dominated ecosystems To better predict and project how seaweed dominated ecosystems will fare in the future we require much more evidence regarding how the effects of climate change will manifest on seaweeds of all types across temperate tropical and polar ecosystems This research topic focuses on how the effects of climate change will manifest on all aspects of seaweed biology and the flow on effects to ecosystem dynamics This research topic calls for papers on all seaweed ecosystem types from kelp forests to coral reefs focusing on manuscripts that examine the effects of any aspect of climate change in the field or laboratory setting or via modelling
