Value Driven Product Planning And Systems Engineering:

Value Driven Product Planning and Systems Engineering Harry E. Cook, Luke A. Wissmann, 2007-08-28 Engineers and scientists often need to sell an innovative idea for a new product or a new product improvement to top management. Sometimes their tendency is to focus on the WOW of the new technology at the expense of making a convincing business case. When the new technology represents a large cost reduction there will be much less of a problem in convincing management to approve the project if the investment level is acceptable. The major rub comes when the new feature or technology is an improvement in customer value that also generates an increase in cost. This makes the sell difficult in spite of the fact that many of the inventive products available today are widely used because they provide very high value in relation to their added cost. Engineers and scientists also occupy product planning positions where they need to be constantly scanning ideas for improving value that come both from inside and outside the company to see if they make sense to incorporate in a future product. At the same time they need to anticipate what their major competitors are likely to do to improve their next generation of product. These problems are exacerbated in today's global economy because the number of competitors has increased markedly in many product segments and there are many technological alternatives available for consideration. The problem of anticipating the moves of your major competitor is particularly challenging because most firms keep plans very secure. The engineer as product planner must learn to think like its major competitor using customer value as a guide. Value Driven Product Planning and Systems Engineering provides essential support for engineers and scientists who are required to make realistic business cases for new innovative product concepts. Product and Systems Development Stanley I. Weiss, 2013-04-23 A thorough treatment of product and systems development in terms of value to all stakeholders. Product and Systems Development compiles more than twenty years of research and practice from a value perspective from vision and marketing to design, manufacturing, delivery, operations, and maintenance. It defines stakeholder value and identifies specific stakeholders in the product and system development process. Covers best practices in development and examines systems engineering, current industry views, and the lifecycle of a value stream. Featuring appendices written by professionals in the field on topics such as Design Structure Matrices, Lean Enablers for systems engineering, and MDAO and simulations, this indispensable guide explains why stakeholders' values can hold the key to fulfillment or defeat of the developer's vision. Emphasizes the succession of value-contributing practices and tools that form a framework for development success. Integrates the technical productivity and customer end-user elements in product and system development. Uses more than 100 tables and figures to illustrate the above processes as well as corollary elements of risk, failure analysis, and fault-tolerant design. Includes numerous case studies and links to online material. Product and Systems Development is an excellent coursebook for senior and graduate students in aerospace, mechanical, civil, electrical, and material engineering as well as management science and engineering. It is also a useful reference for practicing engineers in a variety of technology
