Wireless LAN (WLAN)

- A wireless network is a network in which devices are connected without wires (no cables)
- Wireless networks allow easy access to smart phones, tablets & other devices
- WLANs are not so secure, fast & reliable as compared to wired networks
- Wireless is mainly used for end device connectivity
- More than 80% of your network is still wired (Routers, Switches, Firewalls...)
- Official standard is IEEE 802.11
- WLAN communication is mostly half-duplex

Wireless LAN Radio Frequency

Wireless devices operate in 2.4 and 5 GHz frequency bands in electromagnetic spectrum as shown in below.

- 2.4 GHz (UHF) - 802.11b/g/n/ax
- 5 GHz (SHF) - 802.11a/n/ac/ax

Wireless LAN Security in a SOHO Environment Christian Wimmer, 2008-09-12 Inhaltsangabe Introduction This paper addresses the theory and reality of Wi-Fi security. It provides an overview of security mechanisms and explains how security works in wireless networks. The most important security protocols that are relevant for small office or home office environments are looked upon in more detail. The security of a real world wireless network is being tested with freely available tools and popular attacking methods. It is demonstrated that old security protocols can no longer be seen as being secure at all. To create a holistic view the idea of Wi-Fi security is then expanded to include the physical level. A series of experiments provides insight on how to make a network more secure with materials and tools available in every household. A WLAN that is nearly unreachable outside the perimeter does not attract any potential hackers. The paper concludes with recommendations on where to place your access point and what can be done to shield it. Inhaltsverzeichnis Textprobe
