and single purpose Wireless Sensor Networks have moved towards applications that need support for mobility and multiple purposes. These heterogeneous applications and services demand for a framework which distributes and discovers the various services so that other pieces of equipment can use them. Markus Becker studies, extends analytically models, simulates and employs the so called Trickle algorithm in measurements in a Wireless Sensor Network test bed for the service distribution. The obtained results apply to the application of the Trickle algorithm at lower protocol layers e.g. for routing as well. Given application delay requirements the author derives the realizable distances and number of nodes for two network topologies from the 95 percentiles obtained by simulation.

Wireless Network Performance Handbook Clint Smith, Curt Gervelis, 2003. As wireless networks take ever bigger bites out of the USD 350 billion dollar telephone market they create their own performance problems. International customers require global networks, more customers mean bigger networks, new services create more complicated networks. Then there's changing out the network each time a provider introduces a new technology or capability; it has to do so without interrupting service delivery to existing customers. Here is realistic advice on metrics, troubleshooting methods, design guidelines, revenue assurance and more from a team that has performed the same services for AT&T Wireless, Nextel and Verizon.
