

**TECHNICAL FEATURES****C.D.I. SYSTEM**

In the CDI system, a charge of electricity which is stored in the condenser is discharged with a pulse signal, thus allowing current to flow from the condenser to the primary winding of ignition coil. In other words, no contact breaker is used and no mechanical adjustment is necessary. In addition the CDI system features good spark performance so it is widely used in high performance engines. The rotor and pulser coil base are so constructed that three pulser coils are used to send pulse signals to produce spark in each cylinder. This compact design provides roomy space for the ignition coil and ignition coil.

NOTE:

Special design consideration is given to both water resistance and shock resistance, so that the CDI system ensures almost trouble-free operation.

**Operation****① Charging:**

As indicated by the arrow (→), the negative side of the output current from the charge coil flows and is stored in the condenser. On the other hand, the positive current flows to the power circuit and drives the over-heat and over-rev. control circuit.
