Transaction Processing: Past, Present, and Future Alex Louwe Kooijmans, Elsie Ramos, Niek De Greef, Dominique Delhumeau, Donna Eng Dillenberger, Hilon Potter, Nigel Williams, IBM Redbooks, 2012-09-29 The role of IT is becoming more prominent in people s daily lives and we are becoming increasingly dependent on computers More and more business transactions are being automated for example ordering a book at an online bookstore or transferring money to a bank account in another part of the world No matter the type of transaction we want it to be accurate and we want to have no doubts about its outcome Transactions are also becoming more complex driven by new ways of conducting business and new technologies Smartphones now allow us to conduct transactions anywhere and at anytime Technology paradigms such as Web 2 0 and business event processing enable businesses to increase the dynamics of a transaction through instrumentation that captures events analyzes the associated data and proactively interacts with the client in order to improve the customer experience To adapt to the increasing volume and complexity of transactions requires an ongoing assessment of the current way of supporting transactions with IT No matter what your business is you need to ensure that your transactions are properly completed with integrity Wrong or incomplete results can adversely affect client loyalty affect company profits and lead to claims lawsuits or fines Companies need to be able to rely on computer systems that are 100% reliable and guarantee transaction integrity at all times The IBM mainframe is such a platform Clients that have been using an IBM mainframe are conscious of its added value For this IBM Redguide™ publication we surveyed a number of companies that use the IBM mainframe and we asked them to tell us its most distinguishing qualities They answered unanimously reliability availability and scalability They also do not see an alternative for running their mission

critical business workloads other than the IBM mainframe When we surveyed our clients we also asked them about the future Clearly major future trends demand significantly smarter faster and bigger transaction processing systems than we have today Some of these trends are the availability of new computing paradigms continuing growth of the mobile channel further integration of organizations massive growth of unstructured and uncertain data and increasing complexity of IT systems IBM continues to invest in mainframe technology leadership which protects years of client investments on this platform Today well known transaction processing TP middleware such as the IBM CICS IBM IMS IBM z TPF and IBM WebSphere Application Server products and also solutions for service oriented architecture SOA and business process management BPM are available and fully optimized on the IBM mainframe running the mission critical business workloads of many companies the world over In 2010 IBM announced the IBM zEnterprise system introducing a hybrid computing platform that combines the traditional IBM mainframe capabilities and the ability to use IBM blade servers managed by a single management software With zEnterprise you can significantly reduce the complexity of your IT and achieve better service levels while continuing to benefit from traditional mainframe strengths in transaction processing **IBM Optim Performance**

DB2 12 for z Optimizer Terry Purcell,IBM Redbooks,2017-06-28 There has been a considerable focus on performance improvements as one of the main themes in recent IBM DB2 releases and DB2 12 for IBM z OS is certainly no exception With the high value data retained on DB2 for z OS and the z Systems platform customers are increasingly attempting to extract value from that data for competitive advantage Although customers have historically moved data off platform to gain insight the landscape has changed significantly and allowed z Systems to again converge operational systems with analytics for real time insight Business critical analytics is now requiring the same levels of service as expected for operational systems and real time or near real time currency of data is expected Hence the resurgence of z Systems As a precursor to this shift IDAA brought the data warehouse back to DB2 for z OS and with its tight integration with DB2 significantly reduces data latency

as compared to the ETL processing that is involved with moving data to a stand alone data warehouse environment That change has opened up new opportunities for operational systems to extend the breadth of analytics processing without affecting the mission critical system and integrating near real time analytics within that system all while maintaining the same z Systems qualities of service Apache Spark on z OS and Linux for System z also allow analytics in place in real time or near real time Enabling Spark natively on z Systems reduces the security risk of multiple copies of the Enterprise data while providing an application developer friendly platform for faster insight in a simplified and more secure analytics framework How is all of this relevant to DB2 for z OS Given that z Systems is proving again to be the core Enterprise Hybrid Transactional Analytical Processing HTAP system it is critical that DB2 for z OS can handle its traditional transactional applications and address the requirements for analytics processing that might not be candidates for these rapidly evolving targeted analytics systems And not only are there opportunities for DB2 for z OS to play an increasing role in analytics the complexity of the transactional systems is increasing Analytics is being integrated within the scope of those transactions DB2 12 for z OS has targeted performance to increase the success of new application deployments and integration of analytics to ensure that we keep pace with the rapid evolution of IDAA and Spark as equal partners in HTAP systems This paper describes the enhancements delivered specifically by the query processing engine of DB2 This engine is generally called the optimizer or the Relational Data Services RDS components which encompasses the query transformation access path selection run time and parallelism DB2 12 for z OS also delivers improvements targeted at OLTP applications which are the realm of the Data Manager Index Manager and Buffer Manager components to name a few and are not identified here Although the performance measurement focus is based on reducing CPU improvement in elapsed time is likely to be similarly achieved as CPU is reduced and performance constraints alleviated However elapsed time improvements can be achieved with parallelism and DB2 12 does increase the percentage offload for parallel child tasks which can further reduce chargeable CPU for analytics workloads
