

1 Brief Description of the ZF-AS Tronic

1.1 General

The ZF-AS Tronic transmission system is a combination of an electronically-pneumatically shifted constant mesh gearbox and an automated dry clutch. An electronic engine control unit and CAN communication must be in place before the ZF-AS Tronic transmission system can be used.

The automated clutch (no clutch pedal) renders clutch operation by the driver unnecessary. The actual shift process is undertaken by the electronic transmission control unit.

The driver has the opportunity to drive the vehicle in both semi-automatic mode and fully automatic mode. When in semi-automatic mode, manual shifting is simplified through the use of a range selector.

When in fully automatic mode, gears are selected and shifted by the electronic transmission control unit, although the driver can intervene if so desired. All system functions needed, e.g. Neutral, gear change, clutch overload, and diagnosis information are shown on the display.

Dependability Modelling under Uncertainty Philipp Limbourg, 2008-09-08 Mechatronic design processes have become shorter and more parallelized induced by growing time to market pressure Methods that enable quantitative analysis in early design stages are required should dependability analyses aim to influence the design Due to the limited amount of data in this phase the level of uncertainty is high and explicit modeling of these uncertainties becomes necessary This work introduces new uncertainty preserving dependability methods for early design stages These include the propagation of uncertainty through dependability models the activation of data from similar components for analyses and the integration of uncertain dependability predictions into an optimization framework It is shown that Dempster Shafer theory can be an alternative to probability theory in early design stage dependability predictions Expert estimates can be represented input
