Howard B. Lieberman,2008-02-02 The field of cell cycle regulation is based on the observation that the life cycle of a cell progresses through several distinct phases G1 M S and G2 occurring in a well defined temporal order Details of the mechanisms involved are rapidly emerging and appear extraordinarily complex Furthermore not only is the order of the phases important but in normal eukaryotic cells one phase will not begin unless the prior phase is completed successfully Checkpoint control mechanisms are essentially surveillance systems that monitor the events in each phase and assure that the cell does not progress prematurely to the next phase If conditions are such that the cell is not ready to progress for example because of incomplete DNA replication in S or DNA damage that may interfere with chromosome segregation in M a transient delay in cell cycle progression will occur Once the inducing event is properly handled for example DNA replication is no longer blocked or damaged DNA is repaired cell cycle progression continues Checkpoint controls have recently been the focus of intense study by investigators interested in mechanisms that regulate the cell cycle Furthermore the relationship between checkpoint control and carcinogenesis has additionally enhanced interest in these cell cycle regulatory pathways It is clear that cancer cells often lack these checkpoints and exhibit genomic instability as a result Moreover several tumor suppressor genes participate in checkpoint control and alterations in these genes are associated with genomic instability as well as the development of cancer

Cell Cycle Control Tim Humphrey, Gavin Brooks, 2008-02-04 The fundamental question of how cells grow and divide has perplexed biologists since the development of the cell theory in the mid 19th century when it was recognized by Virchow and others that all cells come from cells In recent years considerable effort has been applied to the identification of the basic molecules and mechanisms that regulate the cell cycle in a number of different organisms Such studies have led to the elucidation of the central paradigms that underpin eukaryotic cell cycle control for which Lee Hartwell Tim Hunt and Paul Nurse were jointly awarded the Nobel Prize for Medicine and Physiology in 2001 in recognition of their seminal contributions to this field The importance of understanding the fundamental mechanisms that modulate cell division has been reiterated by relatively recent discoveries of links between cell cycle control and DNA repair growth cellular metabolism development and cell death This new phase of integrated cell cycle research provides further challenges and opportunities to the biological and medical worlds in applying these basic concepts to understanding the etiology of cancer and other proliferative diseases
