Wildlife - Livestock Interface Joaquín Vicente, Kurt C. Vercauteren, Christian Gortázar, 2021-04-29 Shared diseases among wildlife livestock and humans often transboundary are relevant to public health and global economy as being highlighted currently relative to the global COVID19 pandemic Diseases at these interfaces also impact the conservation of biodiversity and must be considered when managing wildlife While wildlife and domestic livestock have coexisted in dynamic systems for thousands of years spillover disease risks are higher today than in the past due to global patterns of increasing close contact and interactions among wildlife livestock and humans in the context of complex diverse and numerous circumstances Multidisciplinary studies of animal interfaces especially those involving wildlife therefore must be brought to the forefront so that knowledge gaps can be realized and filled to inform managers and policy makers In the first part of the book authors illustrate and discuss ecological and epidemiological concepts related to the interfaces with a vision towards socio ecological system health In addition the history of past animal interfaces provides the necessary perspective to focus current questions better understand present situations and informs how we can best approach the future The second part discusses the myriad of similar and differing wildlife livestock interfaces found around the world from a regional point of view The third part focuses on how to assess the spatial and temporal overlap between livestock and wildlife and authors present new technical innovations about how inter transmissions between wild and domestic populations can be quantified An overview of main modeling approaches available to quantify multi host disease transmission at the wildlife livestock interface illustrated with specific case studies is also presented Finally the need for interdisciplinary approaches and a dedicated thematic field to approach the wildlife livestock interfaces and create opportunities to promote wildlife livestock coexistence is emphasized The concluding chapter presents perspectives and directions to better understanding disease dynamics at the wildlife livestock interface global change and implications for the future The changing distribution of interfaces ongoing human and environmental changes e g climate warming changes in animal production systems etc and their likely impacts and consequences for the interfaces and disease transmission processes are all discussed Dissecting the Pathogenesis of Complex Diseases based on Genome Variation to Promote the Development of Precision Medicine Peng Wang, Xinyi Liu, Fan Zhang, Hui Zhi, 2022-09-22 *Coronavirus Disease - COVID-19* Nima Rezaei, 2021-05-10 In December 2019 the world

witnessed the occurrence of a new coronavirus to humanity The disease spread quickly and became known as a pandemic globally affecting both society and the health care system both the elderly and young groups of people and both the men s and women s groups It was a universal challenge that immediately caused a surge in scientific research Be a part of a world rising in fighting against the pandemic the Coronavirus Disease COVID 19 was depicted in the early days of the pandemic but

The Network of Life David P. Mindell, 2024-06-04 Why evolution is like a network not a family tree and why it matters for understanding the health of all living things In The Network of Life David Mindell explains why the conventional narrative of evolution needs to evolve Ever since Darwin evolution has largely been thought to work like a family tree in which species are related through a series of branching events But today a growing knowledge of the ways species share genetic materials in a process known as horizontal evolution has revealed that evolution is actually a network of shared genealogy in which species are more interconnected than previously thought In this book Mindell presents this new narrative of life s evolution and its profound implications for all life on Earth The Network of Life describes the drivers of horizontal evolution interbreeding and genetic recombination the merger of species horizontal gene transfer and coevolution The network view of evolution that emerges supports a new symbiotic theory of health which holds that the future health of humans other species and our shared environments depends on evolution and adaptation across life s network Difficult times

lie ahead for many of Earth's species as climates and habitats transform. At the same time new and altered life forms are arising and spreading in association with human activities. We are also learning to reshape and create life by mimicking the mechanisms of horizontal evolution and we are coevolving with technology as we enhance our bodies, brains, and life spans. The Network of Life shows why and how increasing our knowledge of horizontal evolution can provide critical lessons as we navigate our looming challenges.
