Basic Processes in Reading Derek Besner, Glyn W. Humphreys, 2012-11-12 The chapters in this new book span the range of reading processes from early visual analysis to semantic influences on word identification thus providing a state of the art summary of current work and offering important contributions to prospective reading research Basic Processes in Reading examines both future plans and past accomplishments in the world of word identification research Three chapters provide a futuristic view taking a parallel distributed processing approach to semantic priming phonology and the identification of old words and the learning of new words Reviews on eye movements in reading and semantic priming on word identification provide a retrospective summary of work on these issues as well as solid pointers for future investigations Other chapters provide new demonstrations of the importance of phonological contributions to word identification of interactive processes in the identification of handwritten words and a re evaluation of the processes involved in the neuropsychological syndrome described as letter by letter reading

Pronounceability and Visual Recognition Processing Luoxuan Zhu, 2018 This study investigates the role of pronounceability in visual recognition of words and non words under a mixed case situation Theoretically two models that predict people's reactions to words and non words formed the basis for the current study the process model Besner Johnston 1989 and the hybrid holistically biased model Allen Wallace Weber 1995 Based on different rationalizations the two proposed models make different predictions about case alternation impacts on words and non words When a word is presented until participants provide a response the process model predicts that a longer response time will be found in words than non words under a mixed case condition whereas the hybrid holistically biased model predicts the opposite result However the predictions made by the Allen group ignored the potential impact of phonology in word recognition processing This study continues the research done by Allen Wallace and Weber 1995 by measuring the pronounceability in non words stimuli to examine whether phonology would affect lexical decision task performance ultimately showing that people identified words significantly faster than non words under a mixed case condition which further confirmed the Allen group's results A significant interactive effect of word type and pronounceability is also found in this study However the results showed no significant effect of pronounceability on participants reaction times

Potential explanations of these results and future research directions for study are discussed
