Uniquely Human The Evolution Of Speech Thought And Selfless Behavior:

Uniquely Human Philip Lieberman, 1991 In a stimulating synthesis of cognitive science anthropology and linguistics Philip Lieberman tackles the fundamental questions of human nature How and why are human beings so different from other species Can the Darwinian theory of evolution explain human linguistic and cognitive ability How do our processes of language and thought differ from those of Homo erectus 500 000 years ago or of the Neanderthals 35 000 years ago What accounts for human moral sense Lieberman believes that evolution for rapid efficient vocal communication forged modern human beings by creating the modern human brain Earlier hominids lacked fully human speech and syntax which together allow us to convey complex thoughts rapidly The author discusses how natural selection acted on older brain mechanisms to produce a structure that can regulate the motor activity necessary for speech and command the complex syntax that enhances the creativity of human language The unique brain mechanisms underlying human language also enhance human cognitive ability allowing us to derive abstract concepts and to plan complex activities These factors are necessary for the development of true altruism and moral behavior Lieberman supports his argument about the evolution of speech and the human brain by combining the comparative method of Charles Darwin insights from archaeology and child development and the results of high tech research with computerized brain scanning and computer models that can recreate speech sounds made by our ancestors over 100 000 years ago Uniquely Human will stimulate fresh thought and controversy on the basic question of how we came to be

Tools, Language and Cognition in Human Evolution Kathleen Rita Gibson, Tim Ingold, 1993 Looks at how humans have evolved complex behaviours such as language and culture **Some Thoughts about the Evolution of Human Behavior: A Literature Survey** Arthur J. Boucot, 2021-05-20 On his death Arthur Boucot 1924 2017 left an unfinished manuscript in which he surveyed the skeletal behavioral and cultural changes that have characterized Homo from its first recognition in the Late Pliocene to the present The results edited after his death provide a heavily referenced sourcebook for future workers in diverse fields

Novel Approaches in Cognitive Informatics and Natural Intelligence Wang, Yingxu, 2008-12-31 Presents the latest advancements in cognitive informatics and natural intelligence Covers the five areas of cognitive informatics natural intelligence autonomic computing knowledge science and relevant development The Notion of Syllable Across History, Theories and Analysis Domenico Russo, 2016-06-22 Any notion linguistically expressed even one such as the syllable is always the result of several different viewpoints In order to take this into account this book draws inspiration from the scheme of quaternion as conceived by Sir William Rowan Hamilton and later introduced in theoretical linguistics by Ferdinand de Saussure The first term of the quaternion The Dawn of the Syllable is provided by historical observations The second term Beyond the Sound of Syllables is composed of different descriptive analyses of the syllable carried out in some particular languages and dialects The third term The Body of Syllables presents the analytical instrumental analysis of the syllable while the fourth De Syllaba Ventura proposes some

theoretical considerations The Origins of Complex Language Andrew Carstairs-McCarthy, 1999 This book proposes a new theory of the origins of human language ability and presents an original account of the early evolution of language It explains why humans are the only language using animals challenges the assumption that language is a consequence of intelligence and offers a new perspective on human uniqueness Brilliantly executed this book draws on evidence from archaeology linguistics cognitive science and evolutionary biology

Cognitive Biology Gennaro Auletta, 2011-07-14 Providing a new conceptual scaffold for further research in biology and cognition this book introduces the new field of Cognitive Biology a systems biology approach showing that further progress in this field will depend on a deep recognition of developmental processes as well as on the consideration of the developed organism as an agent able to modify and control its surrounding environment The role of cognition the means through which the organism is able to cope with its environment cannot be underestimated In particular it is shown that this activity is grounded on a theory of information based on Bayesian probabilities The organism is considered as a cybernetic system able to integrate a processor as a source of variety the genetic system a regulator of its own homeostasis the metabolic system and a selecting system separating the self from the non self the membrane in unicellular organisms Any organism is a complex system that can survive only if it is able to maintain its internal order against the spontaneous tendency towards disruption Therefore it is forced to monitor and control its environment and so to establish feedback circuits resulting in co adaptation Cognitive and biological processes are shown to be inseparable
