Jacoby, William R., Ford Motor Company. Parts and Service Division. Training and Publications Department, 1987 The
Engine Cooling System, 1974 The purpose of the automotive engine cooling system is to control metal temperatures within
safe limits by removing excess heat produced by the engine High speed driving with today's engines can produce enough
heat energy which is rejected to the cooling system to melt an average 200 lb 90.9 kg engine block in 20 min 1 Even driving
at moderate speeds the temperatures inside the engine are extremely high Combustion gas temperatures may be as high as
4500 F 2482 C The heads of the exhaust valves may be red hot and the temperature of lubricated parts such as pistons may
run 200 F 93 C or more above the boiling point of water When metal temperatures are not controlled by adequate cooling the
consequences are lubrication failure and serious engine damage **Troubleshooting the Cooling System** Caterpillar
