Mankind has always been interested in the way people perceive the world and this has become one of its main concerns reflected in the fact that early explanations for visual perception date back to ancient Greece. Studies of visual perception were pursued merely in the field of philosophy until the 20th century, when psychologists, and thereafter neuroscientists, formulated their contributions to this topic. But what are the recent theories and findings regarding visual experience and, what have been the recent developments in related fields such as the psychology and philosophy of visual perception? *Visual Experience: Sensation, Cognition, and Constancy* deals with important questions about visual perception that concern the philosophers and psychologists of our era, with a focus on the phenomenal appearances of size and color. This volume, which is emerged out of a research workshop on Cognitive and Developmental Factors in Perceptual Constancy, held at the Institute for Research in Cognitive Sciences (IRCS) of the University of Pennsylvania in February, 2009, includes both psychologists' empirical and philosophers' phenomenological points of view on spatial and color perception. The volume is edited by Gary Hatfield, Professor of Philosophy at University of Pennsylvania, who is trained in experimental psychology, history of science, and philosophy, and Sarah Allred, Assistant Professor at the Department of Psychology, Rutgers University.

Visual Experience Sensation Cognition And Constancy:

Visual Experience Gary Hatfield, Sarah Allred, 2012-06-21 Seeing happens effortlessly and yet is endlessly complex One of the most fascinating aspects of visual perception is its stability and constancy As we shift our gaze or move about the world the light projected onto the retinas is constantly changing Yet the surrounding objects appear stable in their properties Psychologists have long been interested in constancies exploring questions such as How good is constancy Is constancy a fact about how things look or is it a product of our beliefs and judgments about how things look How can the contents of visual experience be studied experimentally However philosophers have long been interested in characterizing visual experience and have become widely interested in the constancies more recently As psychologists and philosophers have interacted new questions have arisen should we regard any departure from constancy as a failure of the visual system or might it be a reasonable or adaptive response In what circumstances is seeing highly conditioned by cognitive factors such as background assumptions and in what circumstances not Visual Experience explores size constancy and color constancy It considers methodologies for studying conscious visual perception efforts to describe visual experience in relation to constancy what it means that constancy is not always perfect and the conceptual resources needed for explaining visual experience This interdisciplinary book is invaluable for both vision scientists and philosophers of mind [The New Visual Neurosciences](#)

epistemology metaphysics and aesthetics as well as psychology Debates about the nature of our experience of colour and the nature of colour itself are central to contemporary discussion and argument in philosophy of mind and psychology and philosophy of perception This outstanding Handbook contains 29 specially commissioned contributions by leading philosophers and examines the most important aspects of philosophy of colour It is organized into six parts The Importance of Colour to Philosophy The Science and Spaces of Colour Colour Phenomena Colour Ontology Colour Experience and Epistemology Language Categories and Thought The Routledge Handbook of Philosophy of Colour is essential reading for students and researchers in philosophy of mind and psychology epistemology metaphysics and aesthetics as well as for those interested in conceptual issues in the psychology of colour **Colour and Form Perception: Straddling the Boundary**

Galina V. Paramei, Cees van Leeuwen, 2016-05-31 Starting from psychophysics over the last 50 years most progress in unravelling the mechanisms of color vision has been made through the study of single cell responses mainly in LGN and striate cortex A similar development in the study of form perception may seem to be underway centred on the study of temporal cortex However because of the combinatorial characteristics of form perception we are also observing the opposite tendency from single cell activity to population coding and from static receptive field structures to system dynamics and integration and ultimately a synthetic form of psychophysics of color and form perception From single cells to system integration it is this development the present Research Topic wishes to highlight and promote How does this development affect our views on the various attributes of perception In particular we are interested in to what extent evolving knowledge in the field of color perception is relevant within a developing integrative framework of form perception The goal of this Research Topic is to bring together experimental research encompassing both color and form perception For this volume we planned a broad scope of topics on color in complex scenes color and form as well as dynamic aspects of form perception We expect that the Research Topic will be attractive to the community of researchers whose work straddles the boundary between the two visual perception fields as well as to the wider community interested in integrative systems neuroscience
