Analytic Capacity, the Cauchy Transform, and Non-homogeneous Calderón-Zygmund Theory Xavier Tolsa,2013-12-16 This book studies some of the groundbreaking advances that have been made regarding analytic capacity and its relationship to rectifiability in the decade 1995-2005 The Cauchy transform plays a fundamental role in this area and is accordingly one of the main subjects covered Another important topic which may

be of independent interest for many analysts is the so called non homogeneous Calder n Zygmund theory the development of which has been largely motivated by the problems arising in connection with analytic capacity The Painlev problem which was first posed around 1900 consists in finding a description of the removable singularities for bounded analytic functions in metric and geometric terms Analytic capacity is a key tool in the study of this problem In the 1960s Vitushkin conjectured that the removable sets which have finite length coincide with those which are purely unrectifiable Moreover because of the applications to the theory of uniform rational approximation he posed the question as to whether analytic capacity is semiadditive This work presents full proofs of Vitushkin s conjecture and of the semiadditivity of analytic capacity both of which remained open problems until very recently Other related questions are also discussed such as the relationship between rectifiability and the existence of principal values for the Cauchy transforms and other singular integrals The book is largely self contained and should be accessible for graduate students in analysis as well as a valuable resource for researchers

Analytic Capacity, Rectifiability, Menger Curvature and Cauchy Integral Hervé Pajot, 2002-11-26 Based on a graduate course given by the author at Yale University this book deals with complex analysis analytic capacity geometric measure theory rectifiable and uniformly rectifiable sets and harmonic analysis boundedness of singular integral operators on Ahlfors regular sets In particular these notes contain a description of Peter Jones geometric traveling salesman theorem the proof of the equivalence between uniform rectifiability and boundedness of the Cauchy operator on Ahlfors regular sets the complete proofs of the Denjoy conjecture and the Vitushkin conjecture for the latter only the Ahlfors regular case and a discussion of X Tolsa s solution of the Painlev problem

Harmonic Analysis on Spaces of Homogeneous Type Donggao Deng, Yongsheng Han, 2008-11-19 This book could have been entitled Analysis and Geometry The authors are addressing the following issue Is it possible to perform some harmonic analysis on a set Harmonic analysis on groups has a long tradition Here we are given a metric set X with a positive Borel measure and we would like to construct some algorithms which in the classical setting rely on the Fourier transformation Needless to say the Fourier transformation does not exist on an arbitrary metric set This endeavor is not a revolution It is a continuation of a line of research which was initiated a century ago with two fundamental papers that I would like to discuss briefly The first paper is the doctoral dissertation of Alfred Haar which was submitted at to University of Göttingen in July 1907 At that time it was known that the Fourier series expansion of a continuous function may diverge at a given point Haar wanted to know if this phenomenon happens for every 2 orthonormal

basis of L^0 He answered this question by constructing an orthonormal basis today known as the Haar basis with the property that the expansion in this basis of any continuous function uniformly converges to that function *Rectifiability* Pertti Mattila, 2023-01-12 A broad survey of the theory of rectifiability and its deep connections to numerous different areas of mathematics Selected Papers of Alberto P. Calderon with Commentary Alberto P. Calderón, 2008 Alberto Calderon was one of the leading mathematicians of the twentieth century His fundamental pioneering work reshaped the landscape of mathematical analysis This volume presents a wide selection from some of Calderon's most influential papers They range from singular integrals to partial differential equations from interpolation theory to Cauchy integrals on Lipschitz curves from inverse problems to ergodic theory The depth originality and historical impact of these works are vividly illustrated by the accompanying commentaries by some of today's leading figures in analysis In addition two biographical chapters preface the volume They discuss Alberto Calderon's early life and his mathematical career *Fractal Geometry* K. J. Falconer, 1990-03-30 An accessible introduction to fractals useful as a text or reference Part I is concerned with the general theory of fractals and their geometry covering dimensions and their methods of calculation plus the local form of fractals and their projections and intersections Part II contains examples of fractals drawn from a wide variety of areas of mathematics and physics including self similar and self affine sets graphs of functions examples from number theory and pure mathematics dynamical systems Julia sets random fractals and some physical applications Also contains many diagrams and illustrative examples includes computer drawings of fractals and shows how to produce further drawings for themselves

Multiplication Operators on the Bergman Space Kunyu Guo, Hansong Huang, 2015-06-23 This book deals with various aspects of commutants and reducing subspaces of multiplication operators on the Bergman space along with relevant von Neumann algebras generated by these operators which have been the focus of considerable attention from the authors and other experts in recent years The book reviews past developments and offers insights into cutting edge developments in the study of multiplication operators It also provides commentary and comparisons to stimulate research in this area Linear and Complex Analysis Problem Book 3 Victor P. Havin, Nikolai K. Nikolski, 2006-12-08 The 2 volume book is an updated reorganized and considerably enlarged version of the previous edition of the Research Problem Book in Analysis LNM 1043 a collection familiar to many analysts that has sparked off much research This new edition created in a joint effort by a large team of analysts is like its predecessor a collection of unsolved problems of modern analysis designed as informally written mini articles each containing not only a statement of a problem but also historical and methodological comments motivation conjectures and discussion of possible connections of plausible approaches as well as a list of references There are now 342 of these mini articles almost twice as many as in the previous edition despite the fact that a good deal of them have been solved Mathematical Reviews, 2006 **Calderon-Zygmund Capacities and Operators on Nonhomogeneous Spaces** Alexander Volberg, 2003 Singular integral operators play a central role in modern harmonic analysis Simplest examples of singular kernels are given by Calderon Zygmund kernels Many important properties of singular integrals have been thoroughly studied for Calderon Zygmund operators In the 1980 s and early 1990 s Coifman Weiss and Christ noticed that the theory of Calderon Zygmund operators can be generalized from Euclidean spaces to spaces of homogeneous type

The purpose of this book is to make the reader believe that homogeneity previously considered as a cornerstone of the theory is not needed. This claim is illustrated by presenting two harmonic analysis problems famous for their difficulty. The first problem treats semiadditivity of analytic and Lipschitz harmonic capacities. The volume presents the first self contained and unified proof of the semiadditivity of these capacities. The book details Tolosa's solution of Painlevé's and Vitushkin's problems and explains why these are problems of the theory of Calderón Zygmund operators on nonhomogeneous spaces. The exposition is not dimension specific which allows the author to treat Lipschitz harmonic capacity and analytic capacity at the same time. The second problem considered in the volume is a two weight estimate for the Hilbert transform. This problem recently found important applications in operator theory where it is intimately related to spectral theory of small perturbations of unitary operators. The book presents a technique that can be helpful in overcoming rather bad degeneracies, i.e. exponential growth or decay of underlying measure volume on the space where the singular integral operator is considered. These situations occur for example in boundary value problems for elliptic PDE's in domains with extremely singular boundaries. Another example involves harmonic analysis on the boundaries of pseudoconvex domains that goes beyond the scope of Carnot Carathéodory spaces. The book is suitable for graduate students and research mathematicians interested in harmonic analysis.
