to active surveillance in patients with thyroid microcarcinomas to local conservative non surgical therapies such as radiofrequency or alcohol ablation for microcarcinomas and local lymph node metastases and to minimally invasive surgical techniques Few data have been reported about these new techniques but they may become the standard of care particularly for those patients with microcarcinomas with anxiety about active surveillance or for those who present local tumor growth under active surveillance Furthermore in the last decades molecular techniques have opened up new diagnostic scenarios in the pre intervention identification and risk classification of patients with a known diagnosis of thyroid carcinoma that improved patient management and follow up Regarding advanced thyroid tumors new drugs have been developed to control the disease such as multi tyrosine kinase inhibitors and targeted therapies However in some cases tumors become resistant to these drugs Currently there are no reliable markers clinical or molecular that have been found to be predictive of an early escape from therapy control Other drugs for this kind of tumor should be developed to be used as second third or successive treatment and studies combining two or more drugs are needed to explore the possibility of overcoming the resistance to a single therapy
