Sangüesa Escorihuela,2014-11-14 Doctoral Thesis Dissertation from the year 2014 in the subject Engineering Computer Engineering grade Sobresaliente Cum Laude language English abstract In the past people were focused on how to build efficient highways and roads Over time focus shifted to mechanical and automotive engineering in the pursuit of building faster cars to surmount greater distances Later on electronics technology impacted the construction of cars embedding them with sensors advanced electronics and communication devices making cars more intelligent efficient and safe to drive on The applications and advantages of using Vehicular Networks VNs for enhancing road safety and driving efficiency are diverse which explains why research in this area has recently emerged In this Thesis we focus on Vehicular Adhoc Networks VANETs which are a particular subclass of Vehicular Networks that involves a set of equipped vehicles communicating with each other via wireless antennas without requiring the use of any infrastructure In order to enhance the warning message dissemination process usually necessary in VANET safety applications we propose an adaptive broadcast dissemination scheme that automatically chooses the optimal broadcast depending on the complexity of the map and the instantaneous vehicle density in the area Its main goal is to maximize the message delivery effectiveness while generating a reduced number of messages and thus avoiding or mitigating broadcast storms Current research on VANETs usually focuses on analyzing scenarios representing common situations with average densities However situations with very low or very high vehicle densities are often ignored whereas they are very common in real vehicular environments The aim of broadcast dissemination schemes is to maximize message delivery effectiveness something difficult to achieve in adverse density

scenarios To address this issue in this Thesis we propose the Junction Store and Forward JSF and the Neighbor Store and Forward NSF dissemination schemes specially designed to be used under low density conditions as well as the Nearest Junction Located NJL scheme specially developed for high density conditions Finally we present a classification which includes the most relevant broadcast dissemination schemes specially designed for VANETs highlighting their features and studying their performance under the same simulation conditions thus offering researchers a fair comparison We consider that this evaluation can shed some light into the advantages and drawbacks of each solution
