Ad Hoc Networks Jun Zhi-zhong,David Simplot-Ryl,Victor CM Leung,2010-11-30 Ad hoc networks which include a variety of autonomous networks for specific purposes promise a broad range of civilian commercial and military applications These networks were originally envisioned

as collections of autonomous mobile or stationary nodes that dynamically auto configure themselves into a wireless network without relying on any existing network infrastructure or centralized administration With the significant advances in the last decade the concept of ad hoc networks now covers an even broader scope referring to the many types of autonomous wireless networks designed and deployed for a specific task or function such as wireless sensor networks vehicular networks home networks and so on In contrast to the traditional wireless networking paradigm such networks are all characterized by sporadic connections highly error prone communications distributed autonomous operation and fragile multi hop relay paths The new wireless networking paradigm necessitates reexamination of many established concepts and protocols and calls for developing a new understanding of fundamental problems such as interference mobility connectivity capacity and security among others While it is essential to advance theoretical research on fundamental and practical research on efficient policies algorithms and protocols it is also critical to develop useful applications experimental prototypes and real world deployments to achieve an immediate impact on society for the success of this wireless networking paradigm

Revolutionizing Education through Web-Based Instruction Raisinghani, Mahesh, 2016-02-29 The proliferation of technology has affected all aspects of human life yet the continuing possibilities of their effects on education have yet to be fully explored When viewed separately one may believe that only paltry solutions can be wrought from online and web based education however when applied and studied in a dynamic interactive sense these advancements may alter the very notion of learning and education Revolutionizing Education through Web Based Instruction is a comprehensive multi disciplinary exploration of the emerging digital opportunities available to educators This book presents contemporary theoretical frameworks as well as practical research findings that support the use of these new computer assisted teaching techniques The myriad of research based topics featured in this book allow for a thorough diverse discussion about education technology and the intersection therein This title is an invaluable resource for instructors students of education and researchers and professionals in the fields of knowledge management

of enabling the execution of complex experiments that involve the use of distributed scientific instruments must be supported by a number of different architectural domains which inter work in a coordinated fashion to provide the necessary functionality. These domains embrace the physical instruments, the communication network interconnecting the distributed systems, the service oriented abstractions and their middleware. The Grid paradigm or more generally the Service Oriented Architecture (SOA) viewed as a tool for the integration of distributed resources plays a significant role not only to manage computational aspects but increasingly as an aggregator of measurement instrumentation and pervasive large scale data acquisition platforms. In this context the functionality of a SOA allows managing, maintaining and exploiting heterogeneous instrumentation and acquisition devices in a unified way by providing standardized interfaces and common working environments to their users, but the peculiar aspects of dealing with real instruments of widely different categories may add new functional requirements to this scenario. On the other hand, the growing transport capacity of core and access networks allows data transfer at unprecedented speed but new challenges arise from wireless access, wireless sensor networks and the traversal of heterogeneous network domains. The book focuses on all aspects related to the effective exploitation of remote instrumentation and to the building of complex virtual laboratories on top of real devices and infrastructures. These include SOA and related middleware, high speed networking in support of Grid applications, wireless Grids for acquisition devices and sensor networks, Quality of Service (QoS) provisioning for real time control, measurement instrumentation and methodology as well as metrology issues in distributed systems.
