The Visual Brain In Action Oxford Psychology Series:

The Visual Brain in Action David Milner, Mel Goodale, 2006-10-12 First published in 1995 *The Visual Brain in Action* remains a seminal publication in the cognitive sciences It presents a model for understanding the visual processing underlying perception and action proposing a broad distinction within the brain between two kinds of vision conscious perception and unconscious online vision It argues that each kind of vision can occur quasi independently of the other and is separately handled by a quite different processing system In the 11 years since publication the book has provoked considerable interest and debate throughout both cognitive neuroscience and philosophy while the field has continued to flourish and develop For this new edition the text from the original edition has been left untouched standing as a coherent statement of the authors position However a very substantial epilogue has been added to the book in which Milner and Goodale review some of the key developments that support or challenge the views that were put forward in the first edition The new chapter summarizes developments in various relevant areas of psychology neuroscience and behaviour It notably supplements the main text by updating the reader on the contributions that have emerged from the use of functional neuroimaging which was in its infancy when the first edition was written Neuroimaging and functional MRI in particular has revolutionized the field over the past 11 years by allowing investigators to plot in detail the patterns of activity within the visual brains of behaving and perceiving humans The authors show how its use now allows scientists to test and confirm their proposals based as they then were largely on evidence accrued from primate neuroscience in conjunction with studies of neurological patients

Flexible Strategies for Sensory Integration During Motor Planning Samuel Judah Sober,2005 The brains success in perceiving and interacting with the world depends on its ability to assimilate multiple streams of sensory information One particularly important sensory integration problem concerns the use of sensory feedback from the body to plan and execute arm movements Information about arm position is available to both vision and proprioception and these signals must be integrated in order to plan accurate reaches Although both modalities can encode arm position the question of how the brain weights these signals has not been systematically investigated To address this issue we developed a psychophysical technique for quantifying the relative reliance on vision versus proprioception during reach planning Subjects planned and executed reaching movements while receiving virtual visual feedback By analyzing the reaching errors that resulted from shifting the visual feedback away from the true hand position we measured sensory integration at two different stages of reach planning As described in Chapter 1 we found that the first planning stage relies mostly on visual information whereas the second stage relies more on proprioceptive signals This difference suggests that the planning computations performed at each stage inform the selection of sensory input This hypothesis is further supported by the results presented in Chapter 2 in which we show that altering the details of the sensorimotor task drives changes in sensory integration In Chapter 3 we explore the consequences of sensorimotor adaptation on sensory integration and show that the effects of learning can drive changes at a single stage of reach planning Lastly Chapter 4 presents a set of hypotheses about where and how the two planning stages might be implemented in the primate brain and suggests a series of experiments designed to confirm the computational role of single neurons

Visual Reflections Michael McCloskey,2009-04-30

How much can we learn about normal visual perception and cognition from a malfunctioning visual system Quite a lot as Michael McCloskey makes abundantly clear in this book McCloskey presents his work with AH a college student who has an extraordinary deficit in visual perception When AH looks at an object she sees it clearly and identifies it readily yet she is often dramatically mistaken about where the object is or how it is oriented For example she may reach out to grasp an object that she sees on her left but miss

it completely because it is actually on her right or she may see an arrow pointing up when it is really pointing down AH s errors together with many other clues lead McCloskey to some very interesting conclusions about how we perceive the world He develops theoretical claims about visual subsystems the nature of visual location and orientation representations attention and spatial representations the role of the visual system in mental imagery and the levels of the visual system implicated in awareness Visual Reflections makes a fascinating and compelling case that we can often learn more about a process when it goes awry than when it functions flawlessly
