Design of Linear Multivariable Feedback Control Systems Joseph J. Bongiorno Jr., Kiheon Park, 2020-07-09 This book contains a derivation of the subset of stabilizing controllers for analog and digital linear time invariant multivariable feedback control systems that insure stable system errors and stable controller outputs for persistent deterministic reference inputs that are trackable and for persistent deterministic disturbance inputs that are rejectable For this subset of stabilizing controllers the Wiener Hopf methodology is then employed to obtain the

optimal controller for which a quadratic performance measure is minimized This is done for the completely general standard configuration and methods that enable the trading off of optimality for an improved stability margin and or reduced sensitivity to plant model uncertainty are described New and novel results on the optimal design of decoupled non interacting systems are also presented The results are applied in two examples the one and three degree of freedom configurations These demonstrate that the standard configuration is one encompassing all possible feedback configurations Each chapter is completed by a group of worked examples which reveal additional insights and extensions of the theory presented in the chapter Three of the examples illustrate the application of the theory to two physical cases the depth and pitch control of a submarine and the control of a Rosenbrock process In the latter case designs with and without decoupling are compared This book provides researchers and graduate students working in feedback control with a valuable reference for Wiener Hopf theory of multivariable design Basic knowledge of linear systems and matrix theory is required

Advanced, Contemporary Control Andrzej Bartoszewicz, Jacek Kabziński, Janusz Kacprzyk, 2020-06-24 This book presents the proceedings of the 20th Polish Control Conference A triennial event that was first held in 1958 the conference successfully combines its long tradition with a modern approach to shed light on problems in control engineering automation robotics and a wide range of applications in these disciplines The book presents new theoretical results concerning the steering of dynamical systems as well as industrial case studies and worked solutions to real world problems in contemporary engineering It particularly focuses on the modelling identification analysis and design of automation systems however it also addresses the evaluation of their performance efficiency and reliability Other topics include fault tolerant control in robotics automated manufacturing mechatronics and industrial systems Moreover it discusses data processing and transfer issues covering a variety of methodologies including model predictive robust and adaptive techniques as well as algebraic and geometric methods and fractional order calculus approaches The book also examines essential application areas such as transportation and autonomous intelligent vehicle systems robotic arms mobile manipulators cyber physical systems electric drives and both surface and underwater marine vessels Lastly it explores biological and medical applications of the control theory inspired methods *Optomechatronic Systems Control* Farrokh Janabi-Sharifi, 2005 Proceedings of SPIE present the original research papers presented at SPIE conferences and other high quality conferences in the broad ranging fields of optics and photonics These books provide prompt access to the latest innovations in research and technology in their respective fields Proceedings of SPIE are among the most cited references in patent literature Loop-shaping Robust Control Philippe Feyel, 2013-06-12 The loop shaping approach consists of obtaining a specification in relation to the open loop of the control from specifications regarding various closed loop transfers because it is easier to work on a single transfer in addition to the open loop than on a multitude of transfers various loopings such as set point error disturbance error disturbance control etc The simplicity and flexibility of the approach make it very well adapted to the industrial context This

book presents the loop shaping approach in its entirety starting with the declension of high level specifications into a loop shaping specification It then shows how it is possible to fully integrate this approach for the calculation of robust and efficient correctors with the help of existing techniques which have already been industrially tried and tested such as H infinity synthesis The concept of a gap metric or distance between models is also presented along with its connection with the prime factors of a set of systems shaping a ball of models as well as its connections with robust synthesis by loop shaping in order to calculate efficient and robust correctors As H infinity loop shaping is often demanding in terms of the order of correctors the author also looks at loop shaping synthesis under an ordering constraint Two further promising lines of research are presented one using stochastic optimization and the other non smooth optimization Finally the book introduces the concept of correction with two degrees of freedom via the formalism of prime factorization Avenues for future work are also opened up by the author as he discusses the main drawbacks to loop shaping synthesis and how these issues can be solved using modern optimization techniques in an increasingly competitive industrial context in accordance with ever more complex sets of functional specifications associated with increasingly broad conditions of usage
