Thomas, Nick Craswell, 2022-06-01 Simulated test collections may find application in situations where real datasets cannot easily be accessed due to confidentiality concerns or practical inconvenience They can potentially support Information Retrieval IR experimentation tuning validation performance prediction and hardware sizing Naturally the accuracy and usefulness of results obtained from a simulation depend upon the fidelity and generality of the models which underpin it The fidelity of emulation of a real corpus is likely to be limited by the requirement that confidential information in the real corpus should not be able to be extracted from the emulated version We present a range of methods exploring trade offs between emulation fidelity and degree of preservation of privacy We present three different simple types of text generator which work

at a micro level Markov models neural net models and substitution ciphers We also describe macro level methods where we can engineer macro properties of a corpus giving a range of models for each of the salient properties document length distribution word frequency distribution for independent and non independent cases word length and textual representation and corpus growth We present results of emulating existing corpora and for scaling up corpora by two orders of magnitude We show that simulated collections generated with relatively simple methods are suitable for some purposes and can be generated very quickly Indeed it may sometimes be feasible to embed a simple lightweight corpus generator into an indexer for the purpose of efficiency studies Naturally a corpus of artificial text cannot support IR experimentation in the absence of a set of compatible queries We discuss and experiment with published methods for query generation and query log emulation We present a proof of the pudding study in which we observe the predictive accuracy of efficiency and effectiveness results obtained on emulated versions of TREC corpora The study includes three open source retrieval systems and several TREC datasets There is a trade off between confidentiality and prediction accuracy and there are interesting interactions between retrieval systems and datasets Our tentative conclusion is that there are emulation methods which achieve useful prediction accuracy while providing a level of confidentiality adequate for many applications Many of the methods described here have been implemented in the open source project SynthaCorpus accessible at <https://bitbucket.org/davidhawking/synthacorporus>

Algorithms for Data Science Brian Steele, John Chandler, Swarna Reddy, 2016-12-25 This textbook on practical data analytics unites fundamental principles algorithms and data Algorithms are the keystone of data analytics and the focal point of this textbook Clear and intuitive explanations of the mathematical and statistical foundations make the algorithms transparent But practical data analytics requires more than just the foundations Problems and data are enormously variable and only the most elementary of algorithms can be used without modification Programming fluency and experience with real and challenging data is indispensable and so the reader is immersed in Python and R and real data analysis By the end of the book the reader will have gained the ability to adapt algorithms to new problems and carry out innovative analyses This book has three parts a Data Reduction Begins with the concepts of data reduction data maps and information extraction The second chapter introduces associative statistics the mathematical foundation of scalable algorithms and distributed computing Practical aspects of distributed computing is the subject of the Hadoop and MapReduce chapter b Extracting Information from Data Linear regression and data visualization are the principal topics of Part II The authors dedicate a chapter to the critical domain of Healthcare Analytics for an extended example of practical data analytics The algorithms and analytics will be of much interest to practitioners interested in utilizing the large and unwieldy data sets of the Centers for Disease Control and Prevention s Behavioral Risk Factor Surveillance System c Predictive Analytics Two foundational and widely used algorithms k nearest neighbors and naive Bayes are developed in detail A chapter is dedicated to forecasting The last chapter focuses on streaming data and uses publicly accessible data streams originating from the Twitter API and the

NASDAQ stock market in the tutorials This book is intended for a one or two semester course in data analytics for upper division undergraduate and graduate students in mathematics statistics and computer science The prerequisites are kept low and students with one or two courses in probability or statistics an exposure to vectors and matrices and a programming course will have no difficulty The core material of every chapter is accessible to all with these prerequisites The chapters often expand at the close with innovations of interest to practitioners of data science Each chapter includes exercises of varying levels of difficulty The text is eminently suitable for self study and an exceptional resource for practitioners

diversity are discussed and tested and Shannon's measure of uncertainty the entropy is chosen to assess differences in the distributions of words To further explain this variation a range of descriptive explanatory and grouping factors are considered in a series of statistical models The first category includes writing systems word formation patterns registers and styles The second category includes population size non native speaker proportions and language status Grouping factors further elicit whether the results extrapolate across or are limited to specific language families and areas This account marries information theoretic methods with a complex systems framework illustrating how languages adapt to the varying needs of their users It sheds light on the puzzling diversity of human languages in a quantitative data driven and reproducible manner
