Abstract

Over the last twenty years, dense linear algebra libraries have gone through three generations of public domain general purpose packages. In the seventies, the first generation of packages were EISPACK and LINPACK, which implemented a broad spectrum of algorithms for solving dense linear eigenproblems and dense linear systems. In the late eighties, the second generation package called LAPACK was developed. This package attains high performance in a portable fashion while also improving upon the functionality and robustness of LINPACK and EISPACK. Finally, since the early nineties, an effort to port LAPACK to distributed memory networks of computers has been underway as part of the ScalAPACK project.

PLAPACK is a maturing fourth generation package which uses a new, more application-centric, view of vector and matrix distribution, *Physically Based Matrix Distribution*. It also uses an “MPI-like” programming interface that hides distribution and indexing details in opaque objects, provides a natural layering in the library, and provides a straight-forward application interface. In this paper, we give an overview of the design of PLAPACK.

*This project was sponsored in part by the Parallel Research on Invariant Subspace Methods (PRISM) project (ARPA grant P-95006), the NASA High Performance Computing and Communications Program's Earth and Space Sciences Project (NSA Grants NAG5-2497 and NAG5-2511), the Environmental Molecular Sciences construction project at Pacific Northwest National Laboratory (PNNL) (PNNL is a multiprogram national laboratory operated by Battelle Memorial Institute for the U.S. Department of Energy under Contract DE-AC06-76OR0 1830), and the Intel Research Council.
