

The water cycle

The water cycle is the continuous movement of water from the Earth's surface to the atmosphere and back again. Water evaporates from the Earth's surface, rising into the air as water vapor. When the water vapor cools and condenses, it forms clouds.

Clouds can move over long distances, carried by the wind. When the clouds become heavy and full enough, they release the water they are holding in the form of rain or snow. The water falls back to the Earth's surface, where it can either soak into the ground or flow into rivers and lakes.

Some of the water that falls to the Earth's surface flows into the oceans, where it can once again evaporate and start the cycle all over again. The water cycle is an important process that helps to keep the Earth's climate stable and provides us with the water we need to survive.

Questions:

1. What is the water cycle?
2. How does water enter the atmosphere?
3. What happens to water vapor when it cools and condenses?
4. Where does some of the water that falls to the Earth's surface go?
5. Why is the water cycle important?
